SAFETY INFORMATION

MOTORCYCLES ARE SINGLE TRACK VEHICLES. THEIR SAFE USE AND OPERATION ARE DEPENDENT UPON THE USE OF PROPER RIDING TECHNIQUES AS WELL AS THE EXPERTISE OF THE OPERATOR. EVERY OPERATOR SHOULD KNOW THE FOLLOWING REQUIREMENTS BEFORE RIDING THIS MOTORCYCLE.

HE OR SHE SHOULD.

- OBTAIN THOROUGH INSTRUCTIONS FROM A COMPETENT SOURCE ON ALL ASPECTS OF MOTORCYCLE OPERATION.
- OBSERVE THE WARNINGS AND MAINTENANCE REQUIREMENTS IN THE OWNER’S MANUAL
- OBTAIN QUALIFIED TRAINING IN SAFE AND PROPER RIDING TECHNIQUES
- OBTAIN PROFESSIONAL TECHNICAL SERVICE AS INDICATED BY THE OWNER’S MANUAL

AND/OR WHEN MADE NECESSARY BY MECHANICAL CONDITIONS.

Safe riding
- Always make pre-operation checks. Careful checks may help prevent an accident.
- This motorcycle is designed to carry the operator and a passenger.
- The failure of motorists to detect and recognize motorcycles in traffic is the predominating cause of automobile/motorcycle accidents. Many accidents have been caused by an automobile driver who did not see the motorcycle. Making yourself conspicuous appears to be very effective in reducing the chance of this type of accident.

Therefore:
- Wear a brightly colored jacket.
- Use extra caution when you are approaching and passing through intersections, since intersections are the most likely places for motorcycle accidents to occur.
- Ride where other motorists can see you. Avoid riding in another motorist’s blind spot.
- Many accidents involve inexperienced operators. In fact, many operators who have been involved in accidents do not even have a current motorcycle license.
- Make sure that you are qualified and that you only lend your motorcycle to other qualified operators.
- Know your skills and limits. Staying within your limits may help you to avoid an accident.
- We recommend that you practice riding your motorcycle where there is no traffic until you have become thoroughly familiar with the motorcycle and all of its controls.
- Many accidents have been caused by error of the motorcycle operator. A typical error made by the operator is veering wide on a turn.
due to EXCESSIVE SPEED or undercornering (insufficient lean angle for the speed).
- Always obey the speed limit and never travel faster than warranted by road and traffic conditions.
- Always signal before turning or changing lanes. Make sure that other motorists can see you.
- The posture of the operator and passenger is important for proper control.
- The operator should keep both hands on the handlebar and both feet on the operator footrests during operation to maintain control of the motorcycle.
- The passenger should always hold onto the operator, the seat strap or grab bar, if equipped, with both hands and keep both feet on the passenger footrests.
- Never carry a passenger unless he or she can firmly place both feet on the passenger footrests.
- Never ride under the influence of alcohol or other drugs.
- This motorcycle is designed for on-road use only. It is not suitable for off-road use.

**Protective apparel**
The majority of fatalities from motorcycle accidents are the result of head injuries. The use of a safety helmet is the single most critical factor in the prevention or reduction of head injuries.
- Always wear an approved helmet.
- Wear a face shield or goggles. Wind in your unprotected eyes could contribute to an impairment of vision that could delay seeing a hazard.
- The use of a jacket, heavy boots, trousers, gloves, etc., is effective in preventing or reducing abrasions or lacerations.
- Never wear loose-fitting clothes, otherwise they could catch on the control levers, footrests, or wheels and cause injury or an accident.
- Never touch the engine or exhaust system during or after operation. They become very hot and can cause burns. Always wear protective clothing that covers your legs, ankles, and feet.
- A passenger should also observe the above precautions.

**Modifications**
Modifications made to this motorcycle not approved by Yamaha, or the removal of original equipment, may render the motorcycle unsafe for use and may cause severe personal injury. Modifications may also make your motorcycle illegal to use.

**Loading and accessories**
Adding accessories or cargo to your motorcycle can adversely affect stability and handling if the weight distribution of the motorcycle is changed. To avoid the possibility of an accident, use extreme caution when adding cargo or accessories to your motorcycle. Use extra care when riding a motorcycle that has added cargo or accessories.
Here are some general guidelines to follow if loading cargo or adding accessories to your motorcycle.
SAFETY INFORMATION

Loading
The total weight of the operator, passenger, accessories and cargo must not exceed the maximum load limit of 202 kg (445 lb). When loading within this weight limit, keep the following in mind:
- Cargo and accessory weight should be kept as low and close to the motorcycle as possible. Make sure to distribute the weight as evenly as possible on both sides of the motorcycle to minimize imbalance or instability.
- Shifting weights can create a sudden imbalance. Make sure that accessories and cargo are securely attached to the motorcycle before riding. Check accessory mounts and cargo restraints frequently.
- Never attach any large or heavy items to the handlebar, front fork, or front fender. These items, including such cargo as sleeping bags, duffel bags, or tents, can create unstable handling or a slow steering response.

Accessories
Genuine Yamaha accessories have been specifically designed for use on this motorcycle. Since Yamaha cannot test all other accessories that may be available, you must personally be responsible for the proper selection, installation and use of non-Yamaha accessories. Use extreme caution when selecting and installing any accessories.
Keep the following guidelines in mind, as well as those provided under “Loading” when mounting accessories:
- Never install accessories or carry cargo that would impair the performance of your motorcycle. Carefully inspect the accessory before using it to make sure that it does not in any way reduce ground clearance or cornering clearance, limit suspension travel, steering travel or control operation, or obscure lights or reflectors.
- Accessories fitted to the handlebar or the front fork area can create instability due to improper weight distribution or aerodynamic changes. If accessories are added to the handlebar or front fork area, they must be as lightweight as possible and should be kept to a minimum.
- Bulky or large accessories may seriously affect the stability of the motorcycle due to aerodynamic effects. Wind may attempt to lift the motorcycle, or the motorcycle may become unstable in cross winds. These accessories may also cause instability when passing or being passed by large vehicles.
- Certain accessories can displace the operator from his or her normal riding position. This improper position limits the freedom of movement of the operator and may limit control ability. Therefore, such accessories are not recommended.
- Use caution when adding electrical accessories. If electrical accessories exceed the capacity of the motorcycle’s electrical system an electric failure could result, which could cause a dangerous loss of lights or engine power.
Gasoline and exhaust gas

- GASOLINE IS HIGHLY FLAMMABLE:
  - Always turn the engine off when refueling
  - Take care not to spill any gasoline on the engine or exhaust system when refueling
  - Never refuel while smoking or in the vicinity of an open flame
- Never start the engine or let it run for any length of time in a closed area. The exhaust fumes are poisonous and may cause loss of consciousness and death within a short time. Always operate your motorcycle in an area that has adequate ventilation.
- Always turn the engine off before leaving the motorcycle unattended and remove the key from the main switch. When parking the motorcycle, note the following.
  - The engine and exhaust system may be hot, therefore, park the motorcycle in a place where pedestrians or children are not likely to touch these hot areas

- Do not park the motorcycle on a slope or soft ground, otherwise it may fall over.
- Do not park the motorcycle near a flammable source, (e.g., a kerosene heater, or near an open flame), otherwise it could catch fire
- When transporting the motorcycle in another vehicle, make sure that it is kept upright. If the motorcycle should lean over, gasoline may leak out of the fuel tank
- If you should swallow any gasoline, inhale a lot of gasoline vapor, or allow gasoline to get into your eyes, see your doctor immediately. If any gasoline spills on your skin or clothing, immediately wash the affected area with soap and water and change your clothes

Immobilizer system

1 Code re-registering key (red bow)
2 Standard keys (black bow)

This vehicle is equipped with an immobilizer system to help prevent theft by re-registering codes in the standard keys. This system consists of the following:

- a code re-registering key (with a red bow)
- two standard keys (with a black bow) that can be re-registered with new codes
- a transponder (which is installed in the code re-registering key)
- an immobilizer unit
- an ECU

- an immobilizer system indicator light (See page 3-3.)
The key with the red bow is used to register codes in each standard key. Since re-registering is a difficult process, take the vehicle along with all three keys to a Yamaha dealer to have them re-registered. Do not use the key with the red bow for driving. It should only be used for re-registering the standard keys. Always use a standard key for driving.

CAUTION:

- **DO NOT LOSE THE CODE RE-REGISTERING KEY! CONTACT YOUR DEALER IMMEDIATELY IF IT IS LOST!** If the code re-registering key is lost, registering new codes in the standard keys is impossible. The standard keys can still be used to start the vehicle, however if code re-registering is required (i.e., if a new standard key is made or all keys are lost) the entire immobilizer system must be replaced. Therefore, it is highly recommended to use either standard key and keep the code re-registering key in a safe place.
- Do not submerge any key in water.
- Do not expose any key to excessively high temperatures.
- Do not place any key close to magnets (this includes, but not limited to, products such as speakers, etc.).
- Do not place heavy items on any key.
- Do not grind any key or alter its shape.
- Do not disassemble the plastic part of any key.
- Do not put two keys of any immobilizer system on the same key ring.
- Keep the standard keys as well as keys of other immobilizer systems away from this vehicle's code re-registering key.
- Keep other immobilizer system keys away from the main switch as they may cause signal interference.
Main switch/steering lock

ON
All electrical circuits are supplied with power, the meter lighting, taillight, license plate light and auxiliary lights come on, and the engine can be started. The key cannot be removed.

NOTE: The headlights come on automatically when the engine is started and stay on until the key is turned to "OFF", even if the engine stalls.

OFF
All electrical systems are off. The key can be removed.

LOCK
The steering is locked, and all electrical systems are off. The key can be removed.

To lock the steering

1  Push  
2  Turn  

1  Turn the handlebars all the way to the left  
2  Push the key in from the "OFF" position, and then turn it to "LOCK" while still pushing it  
3  Remove the key

The main switch/steering lock controls the ignition and lighting systems, and is used to lock the steering.

NOTE: Be sure to use the standard key (black bow) for regular use of the vehicle. To minimize the risk of losing the code re-registering key (red bow), keep it in a safe place and only use it for code re-registering.
To unlock the steering

1 2

Push the key in, and then turn it to “OFF” while still pushing it.

**CAUTION:**

Do not use the parking position for an extended length of time, otherwise the battery may discharge.

**WARNING**

Never turn the key to “OFF” or “LOCK” while the vehicle is moving, otherwise the electrical systems will be switched off, which may result in loss of control or an accident. Make sure that the vehicle is stopped before turning the key to “OFF” or “LOCK”.

---

**Parking**

The steering is locked, and the taillight, license plate light and auxiliary lights are on. The hazard light and turn signal lights can be turned on, but all other electrical systems are off. The key can be removed. The steering must be locked before the key can be turned to “P”.

This indicator light comes on when the transmission is in the neutral position.

High Beam Indicator light “□”
This indicator light comes on when the high beam of the headlight is switched on.

Oil Level Warning light “□□”
This warning light comes on when the engine oil level is low.
The electrical circuit of the warning light can be checked by turning the key to “ON”.
If the warning light does not come on for a few seconds, then go off, have a Yamaha dealer check the electrical circuit.

NOTE: _________________________
- Even if the oil level is sufficient, the warning light may flicker when riding on a slope or during sudden acceleration or deceleration, but this is not a malfunction.

Fuel Level Warning light “□□”
This warning light comes on when the fuel level drops below approximately 3.4 L (0.90 US gal) (0.75 Imp.gal).
When this occurs, refuel as soon as possible.
The electrical circuit of the warning light can be checked by turning the key to “ON”.
If the warning light does not come on for a few seconds, then go off, have a Yamaha dealer check the electrical circuit.

NOTE: _________________________
- This model is also equipped with a self-diagnosis device for the fuel level detection circuit. If the fuel level detection circuit is defective, the following cycle will be repeated until the malfunction is corrected: The fuel level warning light will flash eight times, then go off for 2.5 seconds. If this occurs, have a Yamaha dealer check the vehicle.

Coolant Temperature Warning light “□”
This warning light comes on when the engine overheats. When this occurs, stop the engine immediately and allow the engine to cool.
The electrical circuit of the warning light can be checked by turning the key to “ON”.
If the warning light does not come on for a few seconds, then go off, have a Yamaha dealer check the electrical circuit.
CAUTION:

Do not operate the engine if it is overheated.

Engine trouble warning light “olian”

This warning light comes on or flashes when an electrical circuit monitoring the engine is defective. When this occurs, have a Yamaha dealer check the self-diagnosis system. (See page 3-8 for an explanation of the self-diagnosis device.)

The electrical circuit of the warning light can be checked by turning the key to “ON”. If the warning light does not come on for a few seconds, then go off, have a Yamaha dealer check the electrical circuit.

Immobilizer system indicator light “1”

The electrical circuit of the indicator light can be checked by turning the key to “ON”.

If the indicator light does not come on for a few seconds, then go off, have a Yamaha dealer check the electrical circuit. When the key is turned to “OFF” and 30 seconds have passed, the indicator light will start flashing indicating the immobilizer system is enabled. After 24 hours have passed, the indicator light will stop flashing, however the immobilizer system is still enabled.

NOTE: 

This model is also equipped with a self-diagnosis device for the immobilizer system. If the immobilizer system is defective, the indicator light will start flashing a pattern and the odometer/trimeter will display a 2-digit code when the key is turned to “ON”.

When this occurs, have a Yamaha dealer check the self-diagnosis system. However, if the indicator light slowly flashes five times, and then quickly flashes two times repeatedly, error code 52 will be displayed. This error could be caused by signal interference. If this occurs, try the following:

1. Use the code re-registering key to start the engine.

NOTE: 

Make sure there are no other immobilizer keys close to the main switch, and do not keep more than one immobilizer key on the same key ring. Immobilizer system keys may cause signal interference, which may prevent the engine from starting.

2. If the engine starts, turn it off, and try starting the engine with the standard keys.

3. If one or both of the standard keys do not start the engine, take the vehicle, the code re-registering key and both standard keys to a Yamaha dealer and have the standard keys re-registered.

The electric tachometer allows the rider to monitor the engine speed and keep it within the ideal power range. When the key is turned to "ON", the tachometer needle will sweep once across the r/min range and then return to zero r/min in order to test the electrical circuit.

CAUTION: Do not operate the engine in the tachometer red zone.
Red zone: 13750 r/min and above
INSTRUMENT AND CONTROL FUNCTIONS

Clock mode

1 Clock
2 Speedometer

Turn the key to “ON”.

To set the clock
1 Push the “SELECT” button and “RESET” button together for at least two seconds.
2. When the hour digits start flashing, push the “RESET” button to set the hours
3 Push the “SELECT” button, and the minute digits will start flashing
4 Push the “RESET” button to set the minutes
5 Push the “SELECT” button and then release it to start the clock.

Odometer, tripmeter, and stopwatch modes

Push the “SELECT” button to switch the display between the odometer mode “ODO”, the tripmeter modes “TRIP A” and “TRIP B” and the stopwatch mode in the following order:

TRIP A → TRIP B → ODO → Stopwatch → TRIP A

If the fuel level warning light comes on (see page 3-3), the odometer display will automatically change to the fuel reserve tripmeter mode “F-TRIP” and start counting the distance traveled from that point. In that case, push the “SELECT” button to switch the display between the various tripmeter, odometer, and stopwatch modes in the following order:

F-TRIP → Stopwatch → TRIP A → TRIP B → ODO → F-TRIP

To reset a tripmeter, select it by pushing the “SELECT” button, and then push the “RESET” button for at least one second. If you do not reset the fuel reserve tripmeter manually, it will reset itself automatically and the display will return to the prior mode after refueling and traveling 5 km (3 mi).

Stopwatch mode

Standard measurement
1. Push the “RESET” button to start the stopwatch
2. Push the “SELECT” button to stop the stopwatch.
3. Push the “SELECT” button again to reset the stopwatch.

Split-time measurement
1 Push the “RESET” button to start the stopwatch
2. Push the "RESET" button to measure split-times (The colon "." will start flashing.)
3. Push the "RESET" button to display the final split-time or push the "SELECT" button to stop the stopwatch and display total elapsed time.
4. Push the "SELECT" button to reset the stopwatch.

**Coolant temperature display**
The coolant temperature display indicates the temperature of the coolant. Push the "RESET" button to switch the coolant temperature display to the air intake temperature display.

**NOTE:**
- Even if the air intake temperature is set to be displayed, the coolant temperature warning light comes on when the engine overheats.
- When the key is turned to "ON", the coolant temperature is automatically displayed, even if the air intake temperature was displayed prior to turning the key to "OFF".
- When the air intake temperature display is selected, "A" is displayed before the temperature.

**Self-diagnosis devices**
This model is equipped with a self-diagnosis device for various electrical circuits.

**NOTE:**
If any of those circuits are defective, the engine trouble warning light will come on, and then the right display will indicate a two-digit error code (e.g., 11, 12, 13). This model is also equipped with a self-diagnosis device for the immobilizer system.

If any of the immobilizer system circuits are defective, the immobilizer system indicator light will flash, and then the right display will indicate a two-digit error code (e.g., 51, 52, 53).

**NOTE:**
If the right display indicates error code 52, this could be caused by transponder interference. If this error code appears, try the following:

1. Use the code re-registering key to start the engine.

**NOTE:**
Make sure there are no other immobilizer keys close to the main switch, and do not keep more than one immobilizer key on the same key ring. Immobilizer...
system keys may cause signal interference, which may prevent the engine from starting.

2. If the engine starts, turn it off and try starting the engine with the standard keys
3. If one or both of the standard keys do not start the engine, take the vehicle, the code re-registering key and both standard keys to a Yamaha dealer and have the standard keys re-registered.

If the right display indicates any error codes, note the code number, and then have a Yamaha dealer check the vehicle.

**CAUTION**
If the display indicates an error code, the vehicle should be checked as soon as possible in order to avoid engine damage.

**Display brightness and shift timing indicator light control mode**
This mode cycles through five control functions, allowing you to make the following settings in the order listed below:

- **Display brightness.**
  This function allows you to adjust the brightness of the displays and tachometer to suit the outside lighting conditions.

- **Shift timing indicator light activity.**
  This function allows you to choose whether or not the indicator light should be activated and whether it should flash or stay on when activated.

- **Shift timing indicator light activation**
  This function allows you to select the engine speed at which the indicator light will be activated.

- **Shift timing indicator light deactivation**
  This function allows you to select the engine speed at which the indicator light will be deactivated.

- **Shift timing indicator light brightness.**
  This function allows you to adjust the brightness of the indicator light to suit your preference.

**NOTE:**
- To make any settings in this mode, you have to cycle through all of its functions. However, if the key is turned to "OFF" or the engine is started before completing the procedure, only the settings made before the "SELECT" button was last pushed will be applied.
- In this mode, the right display shows the current setting for each function (except the shift timing indicator light activity function).

To adjust the brightness of the multifunction meter displays and tachometer:
1. Turn the key to "OFF"
2. Push and hold the "SELECT" button.
3. Turn the key to "ON", and then release the "SELECT" button after five seconds.
4. Push the "RESET" button to select the desired brightness level
5. Push the "SELECT" button to confirm the selected brightness level
   The control mode changes to the shift timing indicator light activity function.

To set the shift timing indicator light activity function
1. Push the "RESET" button to select one of the following indicator light activity settings.
   - The indicator light will stay on when activated. (This setting is selected when the indicator light stays on.)
   - The indicator light will flash when activated. (This setting is selected when the indicator light flashes four times per second.)
   - The indicator light is deactivated, in other words, it will not come on or flash. (This setting is selected when the indicator light flashes once every two seconds.)

2. Push the "SELECT" button to confirm the selected indicator light activity. The control mode changes to the shift timing indicator light activation function.

To set the shift timing indicator light activation function

NOTE:

The shift timing indicator light activation function can be set between 7000 r/min and 15000 r/min. From 7000 r/min to 12000 r/min, the indicator light can be set in increments of 500 r/min. From 12000 r/min to 15000 r/min, the indicator light can be set in increments of 200 r/min.

NOTE:
- The shift timing indicator light deactivation function can be set between 7000 r/min and 15000 r/min. From 7000 r/min to 12000 r/min, the indicator light can be set in increments of 500 r/min. From 12000 r/min to 15000 r/min, the indicator light can be set in increments of 200 r/min.
- Be sure to set the deactivation function to a higher engine speed than for the activation function, otherwise the shift timing indicator light will remain deactivated.

1. Push the "RESET" button to select the desired engine speed for activating the indicator light
2. Push the "SELECT" button to confirm the selected engine speed
   The control mode changes to the shift timing indicator light deactivation function
To adjust the shift timing indicator light brightness

**Clutch lever**

1 Clutch lever

The clutch lever is located at the left handlebar grip. To disengage the clutch, pull the lever toward the handlebar grip. To engage the clutch, release the lever. The lever should be pulled rapidly and released slowly for smooth clutch operation.
The clutch lever is equipped with a clutch switch, which is part of the ignition circuit cut-off system. (See page 3-25.)
INSTRUMENT AND CONTROL FUNCTIONS

Shift pedal

The shift pedal is located on the left side of the engine and is used in combination with the clutch lever when shifting the gears of the 6-speed constant-mesh transmission equipped on this motorcycle.

Brake lever

1 Brake lever
2 Brake lever position adjusting knob
3 Distance between brake lever and handlebar grip
4 "△" mark

The brake lever is located at the right handlebar grip. To apply the front brake, pull the lever toward the handlebar grip. The brake lever is equipped with a position adjusting knob. To adjust the distance between the brake lever and the handlebar grip, turn the adjusting knob while holding the lever pushed away from the handlebar grip. When the desired position is obtained, be sure to set it by aligning a groove on the adjusting knob with the "△" mark on the brake lever.

Fuel tank cap

NOTE: The fuel tank cap cannot be closed unless the key is in the lock. In addition, the key cannot be removed if the cap is not properly closed and locked.

WARNING
Make sure that the fuel tank cap is properly closed before riding.

Fuel

1 Fuel tank filler tube
2 Fuel level

Make sure that there is sufficient fuel in the tank. Fill the fuel tank to the bottom of the filler tube as shown.

⚠️ WARNING ⚠️
- Do not overfill the fuel tank, otherwise it may overflow when the fuel warms up and expands.
- Avoid spilling fuel on the hot engine.

**CAUTION:**
Immediately wipe off spilled fuel with a clean, dry, soft cloth, since fuel may deteriorate painted surfaces or plastic parts.

**Recommended fuel:**
- PREMIUM UNLEADED GASOLINE ONLY

**Fuel tank capacity:**
- 180 L (476 US gal) (396 Imp gal)

**Fuel reserve amount (when the fuel level warning light comes on):**
- 34 L (090 US gal) (075 Imp gal)

**CAUTION:**
Use only unleaded gasoline. The use of leaded gasoline will cause severe damage to internal engine parts, such as the valves and piston rings, as well as to the exhaust system.

Your Yamaha engine has been designed to use premium unleaded gasoline with a research octane number of 95 or higher. If knocking (or pinging) occurs, use a gasoline of a different brand. Use of unleaded fuel will extend spark plug life and reduce maintenance costs.
Catalytic converter
This model is equipped with a catalytic converter in the exhaust chamber.

⚠️ WARNING ⚠️
The exhaust system is hot after operation. Make sure that the exhaust system has cooled down before doing any maintenance work.

⚠️ CAUTION: ⚠️
The following precautions must be observed to prevent a fire hazard or other damages.

- Use only unleaded gasoline. The use of leaded gasoline will cause unreparable damage to the catalytic converter.
- Never park the vehicle near possible fire hazards such as grass or other materials that easily burn.
- Do not allow the engine to idle too long.

To secure a helmet to a helmet holder
1. Remove the passenger seat. (See page 3-18)
2. Attach the helmet to a helmet holder, and then securely install the passenger seat.

WARNING
Never ride with a helmet attached to a helmet holder, since the helmet may hit objects, causing loss of control and possibly an accident.
Adjusting the front fork

This front fork is equipped with spring preload adjusting bolts, rebound damping force adjusting screws and compression damping force adjusting screws.

**WARNING**

Always adjust both fork legs equally, otherwise poor handling and loss of stability may result.

Spring preload

1. Spring preload adjusting bolt

To increase the spring preload and thereby harden the suspension, turn the adjusting bolt on each fork leg in direction (a). To decrease the spring preload and thereby soften the suspension, turn the adjusting bolt on each fork leg in direction (b).

**NOTE:**

Align the appropriate groove on the adjusting mechanism with the top of the front fork cap bolt.

Rebound damping force

1. Rebound damping force adjusting screw

To increase the rebound damping force and thereby harden the rebound damping, turn the adjusting screw on each fork leg in direction (a). To decrease the rebound damping force and thereby soften the rebound damping, turn the adjusting screw on each fork leg in direction (b).

**Spring preload setting:**

- Minimum (soft) 8
- Standard 4
- Maximum (hard) 0

**Rebound damping setting:**

- Minimum (soft) 26 click(s) in direction (b)*
- Standard 10 click(s) in direction (b)*
- Maximum (hard) 1 click(s) in direction (b)*

* With the adjusting screw fully turned in direction (a)
Compressor damping force

1 Compression damping force adjusting screw

To increase the compression damping force and thereby harden the compression damping, turn the adjusting screw on each fork leg in direction (a). To decrease the compression damping force and thereby soften the compression damping, turn the adjusting screw on each fork leg in direction (b).

**CAUTION:**
Never attempt to turn an adjusting mechanism beyond the maximum or minimum settings.

**NOTE:**
Although the total number of clicks of a damping force adjusting mechanism may not exactly match the above specifications due to small differences in production, the actual number of clicks always represents the entire adjusting range. To obtain a precise adjustment, it would be advisable to check the number of clicks of each damping force adjusting mechanism and to modify the specifications as necessary.

**Spring preload**

1 Special wrench
2 Spring preload adjusting ring
3 Position indicator
INSTRUMENT AND CONTROL FUNCTIONS

To increase the spring preload and thereby harden the suspension, turn the adjusting ring in direction (a). To decrease the spring preload and thereby soften the suspension, turn the adjusting ring in direction (b).

NOTE:

- Align the appropriate notch in the adjusting ring with the position indicator on the shock absorber.
- Use the special wrench included in the owner's tool kit to make the adjustment.

#### Spring preload setting:

- Minimum (soft)
  - 1
- Standard
  - 4
- Maximum (hard)
  - 9

#### Rebound damping force

Adjust the rebound damping force as follows:

1. Remove the bolt, loosen and remove the quick fastener screw, and then pull the cowling away from the motorcycle as shown.

2. To increase the rebound damping force and thereby harden the rebound damping, turn the adjusting screw in direction (a). To decrease the rebound damping force and thereby soften the rebound damping, turn the adjusting screw in direction (b).

#### Rebound damping setting:

- Minimum (soft)*:
  - 20 click(s) in direction (b)*
- Standard:
  - 17 click(s) in direction (b)*
- Maximum (hard):
  - 1 click(s) in direction (b)*

* With the adjusting screw fully turned in direction (a).

3. Place the cowling in its original position, install and tighten the quick fastener screw, and then install the bolt.
Compression damping force

1 Compression damping force adjusting screw

To increase the compression damping force and thereby harden the compression damping, turn the adjusting screw in direction (a). To decrease the compression damping force and thereby soften the compression damping, turn the adjusting screw in direction (b).

NOTE: Although the total number of clicks of a damping force adjusting mechanism may not exactly match the specifications listed due to small differences in production, the actual number of clicks always represents the entire adjustment range. To obtain a precise adjustment, it would be advisable to check the number of clicks of each damping force adjusting mechanism and to modify the specifications as necessary.

WARNING
This shock absorber contains highly pressurized nitrogen gas. For proper handling, read and understand the following information before handling the shock absorber. The manufacturer cannot be held responsible for property damage or personal injury that may result from improper handling.
- Do not tamper with or attempt to open the gas cylinder.

- Do not subject the shock absorber to an open flame or other high heat sources, otherwise it may explode due to excessive gas pressure.
- Do not deform or damage the gas cylinder in any way, as this will result in poor damping performance.
- Always have a Yamaha dealer service the shock absorber.
Luggage strap holders

1 Luggage strap holder
2 Hook

There are four luggage strap holders on the bottom of the passenger seat. To use the strap holders, remove the passenger seat, unhook the straps from the hooks, and then install the seat with the straps hanging out from under the passenger seat. (See page 3-18.)

EXUP system

This model is equipped with Yamaha’s EXUP (EXhaust Ultimate Power valve) system. This system boosts engine power by means of a valve that regulates the diameter of the exhaust pipe. The EXUP system valve is constantly adjusted in accordance with the engine speed by a computer-controlled servomotor.

CAUTION:

- The EXUP system has been set and extensively tested at the Yamaha factory. Changing these settings without sufficient technical knowledge may result in poor performance of or damage to the engine.
- If the EXUP system does not operate, have a Yamaha dealer check it.

Sidestand

The sidestand is located on the left side of the frame. Raise the sidestand or lower it with your foot while holding the vehicle upright.

NOTE:...................................................................................................................

The built-in sidestand switch is part of the ignition circuit cut-off system, which cuts the ignition in certain situations. (See further down for an explanation of the ignition circuit cut-off system.)

WARNING ..............................................................................................................

The vehicle must not be ridden with the sidestand down, or if the sidestand cannot be properly moved up (or does not stay up), otherwise the sidestand could contact the ground and distract the operator, resulting in a possible loss of control. Yamaha’s ignition circuit cut-off system has been designed to assist the operator in fulfilling the responsibility of raising the sidestand before starting off. Therefore, check this system regularly as described
below and have a Yamaha dealer re-
pair it if it does not function proper-
ly.

Ignition circuit cut-off system

The ignition circuit cut-off system (com-
prising the sidestand switch, clutch
switch and neutral switch) has the fol-
lowing functions:

- It prevents starting when the trans-
  mission is in gear and the side-
  stand is up, but the clutch lever is
  not pulled.
- It prevents starting when the trans-
  mission is in gear and the clutch le-
  ver is pulled, but the sidestand is
  still down.
- It cuts the running engine when the
  transmission is in gear and the sid-
  estand is moved down.

Periodically check the operation of the
ignition circuit cut-off system according
to the following procedure:

⚠️ WARNING

If a malfunction is noted, have a
Yamaha dealer check the system be-
fore riding.
INSTRUMENT AND CONTROL FUNCTIONS

With the engine turned off
1. Move the sidestand down
2. Make sure that the engine stop switch is turned on
3. Turn the key on
4. Shift the transmission into the neutral position
5. Push the start switch
Does the engine start?

NOTE:
This check is most reliable if performed with a warmed-up engine.

With the engine still running
6. Move the sidestand up
7. Keep the clutch lever pulled
8. Shift the transmission into gear
9. Move the sidestand down
Does the engine stall?

The neutral switch may be defective
The motorcycle should not be ridden until checked by a Yamaha dealer

After the engine has stalled.
10. Move the sidestand up
11. Keep the clutch lever pulled
12. Push the start switch
Does the engine start?

The sidestand switch may be defective
The motorcycle should not be ridden until checked by a Yamaha dealer

The system is OK. The motorcycle can be ridden.
The condition of a vehicle is the owner’s responsibility. Vital components can start to deteriorate quickly and unexpectedly, even if the vehicle remains unused (for example, as a result of exposure to the elements). Any damage, fluid leakage or loss of tire air pressure could have serious consequences. Therefore, it is very important, in addition to a thorough visual inspection, to check the following points before each ride.

**NOTE:**

Pre-operation checks should be made each time the vehicle is used. Such an inspection can be accomplished in a very short time; and the added safety it assures is more than worth the time involved.

**WARNING**

If any item in the Pre-operation check list is not working properly, have it inspected and repaired before operating the vehicle.

OPERATION AND IMPORTANT RIDING POINTS

---

**WARNING**

- Become thoroughly familiar with all operating controls and their functions before riding. Consult a Yamaha dealer regarding any control or function that you do not thoroughly understand.

- Never start the engine or operate it in a closed area for any length of time. Exhaust fumes are poisonous, and inhaling them can cause loss of consciousness and death within a short time. Always make sure that there is adequate ventilation.

- Before starting out, make sure that the sidestand is up. If the sidestand is not raised completely, it could contact the ground and distract the operator, resulting in a possible loss of control.

---

**Starting the engine**

In order for the ignition circuit cut-off system to enable starting, one of the following conditions must be met:

- The transmission is in the neutral position
- The transmission is in gear with the clutch lever pulled and the sidestand up

---

**WARNING**

- Before starting the engine, check the function of the ignition circuit cut-off system according to the procedure described on page 3-25.

- Never ride with the sidestand down.

1. Turn the key to "ON" and make sure that the engine stop switch is set to " (“".

---

**CAUTION:**

The following warning lights and indicator light should come on for a few seconds, then go off.

- Oil level warning light
- Fuel level warning light
- Coolant temperature warning light
- Shift timing indicator light
- Engine trouble warning light
- Immobilizer system indicator light

If a warning or indicator light does not go off, see page 3-3 for the corresponding warning and indicator light circuit check.

---

2. Shift the transmission into the neutral position

---

**NOTE:**
When the transmission is in the neutral position, the neutral indicator light should be on, otherwise have a Yamaha dealer check the electrical circuit.

3. Start the engine by pushing the start switch

---

**NOTE:**
If the engine fails to start, release the start switch, wait a few seconds, and then try again. Each starting attempt should be as short as possible to pre-
serve the battery. Do not crank the engine more than 10 seconds on any one attempt.

CAUTION:
For maximum engine life, always warm the engine up before starting off. Never accelerate hard when the engine is cold!

NOTE: The engine is warm when it quickly responds to the throttle.

Shifting

1. Shift pedal
2. Neutral position

Shifting gears lets you control the amount of engine power available for starting off, accelerating, climbing hills, etc.

The gear positions are shown in the illustration.

NOTE:
To shift the transmission into the neutral position, press the shift pedal down repeatedly until it reaches the end of its travel, and then slightly raise it.

- Even with the transmission in the neutral position, do not coast for long periods of time with the engine off, and do not tow the motorcycle for long distances. The transmission is properly lubricated only when the engine is running. Inadequate lubrication may damage the transmission.
- Always use the clutch while changing gears to avoid damaging the engine, transmission, and drive train, which are not designed to withstand the shock of forced shifting.
Tips for reducing fuel consumption
Fuel consumption depends largely on your riding style. Consider the following tips to reduce fuel consumption.
- Shift up swiftly, and avoid high engine speeds during acceleration.
- Do not rev the engine while shifting down, and avoid high engine speeds with no load on the engine.
- Turn the engine off instead of letting it idle for an extended length of time (e.g., in traffic jams, at traffic lights or at railroad crossings).

Engine break-in
There is never a more important period in the life of your engine than the period between 0 and 1600 km (1000 mi). For this reason, you should read the following material carefully.
Since the engine is brand new, do not put an excessive load on it for the first 1600 km (1000 mi). The various parts in the engine wear and polish themselves to the correct operating clearances. During this period, prolonged full-throttle operation or any condition that might result in engine overheating must be avoided.

0–1000 km (0–600 mi)
Avoid prolonged operation above 7000 r/min.

1000–1600 km (600–1000 mi)
Avoid prolonged operation above 8000 r/min.

CAUTION
After 1000 km (600 mi) of operation, the engine oil must be changed and the oil filter cartridge or element replaced.

1600 km (1000 mi) and beyond
The vehicle can now be operated normally.

CAUTION
- Keep the engine speed out of the tachometer red zone.
- If any engine trouble should occur during the engine break-in period, immediately have a Yamaha dealer check the vehicle.
Parking
When parking, stop the engine, and then remove the key from the main switch.

WARNING
- Since the engine and exhaust system can become very hot, park in a place where pedestrians or children are not likely to touch them.
- Do not park on a slope or on soft ground, otherwise the vehicle may overturn.

CAUTION:
Never park in an area where there are fire hazards such as grass or other flammable materials.
PERIODIC MAINTENANCE AND MINOR REPAIR

Safety is an obligation of the owner. Periodic inspection, adjustment and lubrication will keep your vehicle in the safest and most efficient condition possible. The most important points of inspection, adjustment, and lubrication are explained on the following pages. The intervals given in the periodic maintenance and lubrication chart should be simply considered as a general guide under normal riding conditions. However, depending on the weather, terrain, geographical location, and individual use, the maintenance intervals may need to be shortened.

WARNING
If you are not familiar with maintenance work, have a Yamaha dealer do it for you.

Owner's tool kit

1 Owner's tool kit

The owner's tool kit is located under the passenger seat (See page 3-18.) The service information included in this manual and the tools provided in the owner's tool kit are intended to assist you in the performance of preventive maintenance and minor repairs. However, additional tools such as a torque wrench may be necessary to perform certain maintenance work correctly.

NOTE:
If you do not have the tools or experience required for a particular job, have a Yamaha dealer perform it for you.

WARNING
Modifications not approved by Yamaha may cause loss of performance and render the vehicle unsafe for use. Consult a Yamaha dealer before attempting any changes.

WARNING
Do not touch the muffler bracket until the exhaust system has cooled.

1 Muffler bracket
Periodic maintenance and lubrication chart

NOTE:
- The annual checks must be performed every year, except if a kilometer-based maintenance is performed instead.
- From 50000 km, repeat the maintenance intervals starting from 10000 km
- Items marked with an asterisk should be performed by a Yamaha dealer as they require special tools, data and technical skills

NOTE:

- Air filter
  - This model's air filter is equipped with a disposable oil-coated paper element, which must not be cleaned with compressed air to avoid damaging it.
  - The air filter element needs to be replaced more frequently when riding in unusually wet or dusty areas.
- Hydraulic brake service
  - Regularly check and, if necessary, correct the brake fluid level.
  - Every two years replace the internal components of the brake master cylinders and calipers, and change the brake fluid.
  - Replace the brake hoses every four years and if cracked or damaged.
Removing and installing the cowling and panels
The cowling and panels shown need to be removed to perform some of the maintenance jobs described in this chapter. Refer to this section each time the cowling or a panel needs to be removed and installed.

Cowling A

To remove the cowling
Remove the bolt, loosen and remove the quick fastener screws, slide the cowling backward, and then remove it.
2. Place the cowling in its original position, install and tighten the quick fastener screws, and then install the bolt.

Panels A and C

To remove one of the panels
Remove the screw, and then pull the panel off as shown

Panels B and D

To remove one of the panels
1. Remove the rider seat. (See page 3-18.)
2. Remove the screw, and then remove the panel as shown.

To install the panel
Place the panel in the original position, and then install the screw

Checking the spark plugs
The spark plugs are important engine components, which should be checked periodically, preferably by a Yamaha dealer. Since heat and deposits will cause any spark plug to slowly erode, they should be removed and checked in accordance with the periodic maintenance and lubrication chart. In addition, the condition of the spark plugs can reveal the condition of the engine. The porcelain insulator around the center electrode of each spark plug should be a medium-to-light tan (the ideal color when the vehicle is ridden normally), and all spark plugs installed in the engine should have the same color. If any spark plug shows a distinctly different color, the engine could be defective. Do not attempt to diagnose such problems yourself. Instead, have a Yamaha dealer check the vehicle. If a spark plug shows signs of electrode erosion and excessive carbon or other deposits, it should be replaced.

Specified spark plug:
NGK/CR9EK

Before installing a spark plug, the spark plug gap should be measured with a wire thickness gauge and, if necessary, adjusted to specification.

1 Spark plug gap

**Spark plug gap:**
0.6–0.7 mm (0.024–0.028 in)

Clean the surface of the spark plug gasket and its mating surface, and then wipe off any grime from the spark plug threads.

**Tightening torque:**
Spark plug:
12.5 Nm (125 m kgf, 9 ft lb)
PERIODIC MAINTENANCE AND MINOR REPAIR

NOTE: If a torque wrench is not available when installing a spark plug, a good estimate of the correct torque is 1/4–1/2 turn past finger tight. However, the spark plug should be tightened to the specified torque as soon as possible.

CAUTION: Do not use any tools to remove or install the spark plug cap, otherwise the ignition coil coupler may get damaged. The spark plug cap may be difficult to remove because the rubber seal on the end of the cap fits tightly. To remove the spark plug cap, simply twist it back and forth while pulling it out; to install it, twist it back and forth while pushing it in.

Engine oil and oil filter cartridge
The engine oil level should be checked before each ride. In addition, the oil must be changed and the oil filter cartridge replaced at the intervals specified in the periodic maintenance and lubrication chart.

To check the engine oil level
1. Place the vehicle on a level surface and hold it in an upright position.

NOTE: Make sure that the vehicle is positioned straight up when checking the oil level. A slight tilt to the side can result in an incorrect reading.

2. Start the engine, warm it up for several minutes, and then turn it off.
3. Wait a few minutes until the oil settles, and then check the oil level through the check window located in the bottom-right side of the crankcase.

NOTE: The engine oil should be between the minimum and maximum level marks.

4. If the engine oil is at or below the minimum level mark, add sufficient oil of the recommended type to raise it to the correct level as follows.
   a. Fit the rubber protector on the special wrench.

NOTE: The special wrench and rubber protector are included in the owner's tool kit.
b. Remove the engine oil filler cap with the special wrench as shown.

2. Start the engine, warm it up for several minutes, and then turn it off.
3. Place an oil pan under the engine to collect the used oil.
4. Remove the engine oil filler cap with the special wrench.
5. Remove the engine oil drain bolt to drain the oil from the crankcase.

To change the engine oil (with or without oil filter cartridge replacement)
1. Remove cowling A. (See page 6-6)

NOTE:
An oil filter wrench is available at a Yamaha dealer.

7. Apply a thin coat of engine oil to the O-ring of the new oil filter cartridge.

NOTE:
Skip steps 6-8 if the oil filter cartridge is not being replaced.

6. Remove the oil filter cartridge with an oil filter wrench.
10. Add the specified amount of the recommended engine oil, and then install and tighten the oil filler cap with the special wrench.

**Recommended engine oil:**
See page 8-1.

**Oil quantity:**
- Without oil filter cartridge replacement
  - 2.90 L (3.07 US qt) (2.55 Imp qt)
- With oil filter cartridge replacement
  - 3.10 L (3.28 US qt) (2.73 Imp qt)

**CAUTION:**
- In order to prevent clutch slippage (since the engine oil also lubricates the clutch), do not mix any chemical additives. Do not use oils with a diesel specification of "CD" or oils of a higher quality than specified. In addition, do not use oils labeled "ENERGY CONSERVING II" or higher.
- Make sure that no foreign material enters the crankcase.

**Tightening torque:**

**Oil filter cartridge**
- 17 Nm (170 kgf cm, 12 ft-lbf)

**Engine oil drain bolt**
- 43 Nm (430 kgf cm, 31 ft-lbf)

---

8. Install the new oil filter cartridge with an oil filter wrench, and then tighten it to the specified torque with a torque wrench.

**NOTE:**
Make sure that the O-ring is properly seated.

9. Install the engine oil drain bolt, and then tighten it to the specified torque.

**NOTE:**
Check the washer for damage and replace it if necessary.
11. Start the engine, and then let it idle for several minutes while checking for oil leakage. If oil is leaking, immediately turn the engine off and check for the cause.

**NOTE:**

After the engine is started, the engine oil level warning light should go off if the oil level is sufficient.

---

**CAUTION:**

If the oil level warning light flickers or remains on, immediately turn the engine off and have a Yamaha dealer check the vehicle.

12. Turn the engine off, and then check the oil level and correct it if necessary.
13. Install the cowling

---

**Coolant**

The coolant level should be checked before each ride. In addition, the coolant must be changed at the intervals specified in the periodic maintenance and lubrication chart.

**To check the coolant level**

1. Place the vehicle on a level surface and hold it in an upright position.

**NOTE:**

- The coolant level must be checked on a cold engine since the level varies with engine temperature.
- Make sure that the vehicle is positioned straight up when checking the coolant level. A slight tilt to the side can result in an incorrect reading.

2. Check the coolant level in the coolant reservoir.

**NOTE:**

The coolant should be between the minimum and maximum level marks.

---

1. Maximum level mark
2. Minimum level mark
3. If the coolant is at or below the minimum level mark, remove the brake fluid reservoir bracket screw, remove the coolant reservoir cap, and then add coolant to the maximum level mark.

---

1. Brake fluid reservoir bracket screw
1 Coolant reservoir cap

Coolant reservoir capacity (up to the maximum level mark):
0.25 L (0.26 US qt) (0.22 Imp qt)

CAUTION:

- If coolant is not available, use distilled water or soft tap water instead. Do not use hard water or salt water since it is harmful to the engine.
- If water has been used instead of coolant, replace it with coolant as soon as possible, otherwise the engine may not be sufficiently cooled and the cooling system will not be protected against frost and corrosion.

If water has been added to the coolant, have a Yamaha dealer check the antifreeze content of the coolant as soon as possible, otherwise the effectiveness of the coolant will be reduced.

The coolant must be changed at the intervals specified in the periodic maintenance and lubrication chart. Have a Yamaha dealer change the coolant.

WARNING

Never attempt to remove the radiator cap when the engine is hot.

4 Install the coolant reservoir cap, and then install the brake fluid reservoir bracket screw.

NOTE:

- The radiator fan is automatically switched on or off according to the coolant temperature in the radiator
- If the engine overheats, see page 6-42 for further instructions.

Changing the coolant

WARNING

Never attempt to remove the radiator cap when the engine is hot.
Replacing the air filter element

The air filter element should be replaced at the intervals specified in the periodic maintenance and lubrication chart. Replace the air filter element more frequently if you are riding in unusually wet or dusty areas.

1. Remove the rider seat (See page 3-18)
2. Remove panels B and D (See page 6-6.)
3. Remove the bolts

![Diagram of air filter element removal](image)

1. Bolt

4. Lift the front of the fuel tank, and then tilt it back and away from the air filter case (Do not disconnect the fuel hoses!)

**WARNING**

- Make sure that the fuel tank is well supported.
- Do not tilt or pull the fuel tank too much, otherwise the fuel hoses may come loose, which could cause fuel leakage.

5. Remove the rubber cap, and then remove the air filter case cover by removing the screws.

**CAUTION**

When removing the air filter case cover, be careful not to allow foreign objects to drop into the air intake manifold.
6. Remove the air filter element.

7. Install a new air filter element into the air filter case.

**CAUTION:**
- Make sure that the air filter element is properly seated in the air filter case.
- The engine should never be operated without the air filter element installed, otherwise the piston(s) and/or cylinder(s) may become excessively worn.

8. Install the air filter case cover by installing the screws, and then install the rubber cap.

9. Place the fuel tank in its original position, and then install the bolts.

10. Install the panels.

11. Install the rider seat.

**WARNING**
- Before installing the fuel tank, make sure that the fuel hoses are not damaged. If any fuel hose is damaged, do not start the engine. Have a Yamaha dealer replace the hose, otherwise fuel may leak.
- Make sure that the fuel hoses are properly connected and routed, and are not pinched.
- Be sure to place the fuel tank breather/overflow hose in its original position.

**1** Fuel tank breather/overflow hose
Adjusting the engine idling speed

The engine idling speed must be checked and, if necessary, adjusted as follows at the intervals specified in the periodic maintenance and lubrication chart.

The engine should be warm before making this adjustment.

NOTE:

The engine is warm when it quickly responds to the throttle.

Check the engine idling speed and, if necessary, adjust it to specification by turning the idle adjusting screw. To increase the engine idling speed, turn the screw in direction (a). To decrease the engine idling speed, turn the screw in direction (b).

Engine idling speed:
1150–1250 r/min

NOTE:

If the specified idling speed cannot be obtained as described above, have a Yamaha dealer make the adjustment.

Adjusting the throttle cable free play

1 Throttle cable free play

The throttle cable free play should measure 3.0–5.0 mm (0.12–0.20 in) at the throttle grip. Periodically check the throttle cable free play and, if necessary, have a Yamaha dealer adjust it.
Adjusting the valve clearance
The valve clearance changes with use, resulting in improper air-fuel mixture and/or engine noise. To prevent this from occurring, the valve clearance must be adjusted by a Yamaha dealer at the intervals specified in the periodic maintenance and lubrication chart.

Tires
To maximize the performance, durability, and safe operation of your motorcycle, note the following points regarding the specified tires.

Tire air pressure
The tire air pressure should be checked and, if necessary, adjusted before each ride.

⚠️ WARNING ⚠️
- The tire air pressure must be checked and adjusted on cold tires (i.e., when the temperature of the tires equals the ambient temperature).
- The tire air pressure must be adjusted in accordance with the riding speed and with the total weight of rider, passenger, cargo, and accessories approved for this model.

Tire air pressure (measured on cold tires):
- **0–90 kg (0–198 lb):**
  - Front: 250 kPa (36 psi) (2.50 kgf/cm²)
  - Rear: 290 kPa (42 psi) (2.90 kgf/cm²)
- **90–202 kg (198–445 lb):**
  - Front: 250 kPa (36 psi) (2.50 kgf/cm²)
  - Rear: 290 kPa (42 psi) (2.90 kgf/cm²)

High-speed riding:
- **Front:** 250 kPa (36 psi) (2.50 kgf/cm²)
- **Rear:** 290 kPa (42 psi) (2.90 kgf/cm²)

Maximum load*:
- 202 kg (445 lb)
* Total weight of rider, passenger, cargo and accessories

⚠️ WARNING ⚠️
Proper loading of your vehicle is important for several characteristics of your vehicle, such as handling, braking, performance and safety. Do not carry loosely packed items that can shift. Securely pack your heaviest items close to the center of the vehicle, and distribute the weight...
PERIODIC MAINTENANCE AND MINOR REPAIR

evenly from side to side. Properly adjust the suspension for your load, and check the condition and pressure of your tires. NEVER OVERLOAD YOUR VEHICLE. Make sure that the total weight of the cargo, rider, passenger, and accessories (cowling, saddlebags, etc. if approved for this model) does not exceed the maximum load of the vehicle. Operation of an overloaded vehicle could cause tire damage, an accident, or even injury.

Always check the tires before operating the motorcycle. If a tire tread shows crosswise lines (minimum tread depth), if the tire has a nail or glass fragments in it, or if the sidewall is cracked, contact a Yamaha dealer immediately and have the tire replaced.

NOTE: ____________________________
The tire tread depth limits may differ from country to country. Always comply with the local regulations.

Tire information

1 Tire air valve
2 Tire air valve core
3 Tire air valve cap with seal

This motorcycle is equipped with cast wheels and tubeless tires with valves

![Warning]

- The front and rear tires should be of the same make and design, otherwise the handling characteristics of the motorcycle cannot be guaranteed.

Minimum tire tread depth (front and rear):
1 0 mm (0.04 in)
PERIODIC MAINTENANCE AND MINOR REPAIR

- After extensive tests, only the tires listed below have been approved for this model by Yamaha Motor Co., Ltd.
- Always make sure that the valve caps are securely installed to prevent air pressure leakage.
- Use only the tire valves and valve cores listed below to avoid tire deflation during a high-speed ride.

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>This motorcycle is fitted with super-high-speed tires. Note the following points in order to make the most efficient use of these tires.</td>
</tr>
</tbody>
</table>

- Use only the specified replacement tires. Other tires may run the danger of bursting at super high speeds.
- Brand-new tires can have a relatively poor grip on certain road surfaces until they have been “broken in”. Therefore, it is advisable before doing any high-speed riding to ride conservatively for approximately 100 km (60 mi) after installing a new tire.
- The tires must be warmed up before a high-speed run.
- Always adjust the tire air pressure according to the operating conditions.

Cast wheels

To maximize the performance, durability, and safe operation of your vehicle, note the following points regarding the specified wheels.

- The wheel rims should be checked for cracks, bends or warpage before each ride. If any damage is found, have a Yamaha dealer replace the wheel. Do not attempt even the smallest repair to the wheel. A deformed or cracked wheel must be replaced.
- The wheel should be balanced whenever either the tire or wheel has been changed or replaced. An unbalanced wheel can result in poor performance, adverse handling characteristics, and a shortened tire life.
- Ride at moderate speeds after changing a tire since the tire surface must first be “broken in” for it to develop its optimal characteristics.

Front tire:
- Size: 120/70 ZR17M/C (58W)
- Manufacturer/model: MICHELIN/Pilot POWER C DUNLOP/D218FL

Rear tire:
- Size: 190/50 ZR17M/C (73W)
- Manufacturer/model: MICHELIN/Pilot POWER G DUNLOP/D218L

FRONT and REAR:
- Tire air valve: TR412
- Valve core: #9000A (original)
Adjusting the clutch lever free play

1 Clutch lever free play adjusting bolt
2 Clutch lever free play

The clutch lever free play should measure 10–15.0 mm (0.39–0.59 in) as shown. Periodically check the clutch lever free play and, if necessary, adjust it as follows.

To increase the clutch lever free play, turn the adjusting bolt at the clutch lever in direction (a). To decrease the clutch lever free play, turn the adjusting bolt in direction (b).

NOTE: ________________
If the specified clutch lever free play cannot be obtained as described above, proceed as follows.

1. Fully turn the adjusting bolt at the clutch lever in direction (a) to loosen the clutch cable.
2. Loosen the locknut at the crankcase.
3. To increase the clutch lever free play, turn the adjusting nut in direction (a). To decrease the clutch lever free play, turn the adjusting nut in direction (b).

Adjusting the rear brake light switch

1 Rear brake light switch
2 Rear brake light switch adjusting nut

The rear brake light switch, which is activated by the brake pedal, is properly adjusted when the brake light comes on just before braking takes effect. If necessary, adjust the brake light switch as follows:

Turn the adjusting nut while holding the rear brake light switch in place. To make the brake light come on earlier, turn the adjusting nut in direction (a). To make the brake light come on later, turn the adjusting nut in direction (b).
PERIODIC MAINTENANCE AND MINOR REPAIR

Checking the front and rear brake pads
The front and rear brake pads must be checked for wear at the intervals specified in the periodic maintenance and lubrication chart.

Front brake pads

1 Brake pad wear indicator
Each front brake pad is provided with a wear indicator, which allows you to check the brake pad wear without having to disassemble the brake. To check the brake pad wear, check the position of the wear indicator while applying the brake. If a brake pad has worn to the point that the wear indicator almost touches the brake disc, have a Yamaha dealer replace the brake pads as a set.

Rear brake pads

1 Lining thickness
Check each rear brake pad for damage and measure the lining thickness. If a brake pad is damaged or if the lining thickness is less than 1 mm (0.04 in), have a Yamaha dealer replace the brake pads as a set.

Checking the brake fluid level
Front brake

1 Minimum level mark

Rear brake

1 Minimum level mark
Insufficient brake fluid may allow air to enter the brake system, possibly causing it to become ineffective.
PERIODIC MAINTENANCE AND MINOR REPAIR

Before riding, check that the brake fluid is above the minimum level mark and replenish if necessary. A low brake fluid level may indicate worn brake pads and/or brake system leakage. If the brake fluid level is low, be sure to check the brake pads for wear and the brake system for leakage.

Observe these precautions:

- When checking the fluid level, make sure that the top of the brake fluid reservoir is level.
- Use only the recommended quality brake fluid, otherwise the rubber seals may deteriorate, causing leakage and poor braking performance.
- Be careful that water does not enter the brake fluid reservoir when refilling. Water will significantly lower the boiling point of the fluid and may result in vapor lock.
- Brake fluid may deteriorate painted surfaces or plastic parts. Always clean up spilled fluid immediately.
- As the brake pads wear, it is normal for the brake fluid level to gradually go down. However, if the brake fluid level goes down suddenly, have a Yamaha dealer check the cause.

**Recommended brake fluid:**

DOT 4

- Refill with the same type of brake fluid. Mixing fluids may result in a harmful chemical reaction and lead to poor braking performance.

**Changing the brake fluid**

Have a Yamaha dealer change the brake fluid at the intervals specified in the NOTE after the periodic maintenance and lubrication chart. In addition, have the oil seals of the master cylinders and calipers as well as the brake hoses replaced at the intervals listed below or whenever they are damaged or leaking:

- Oil seals: Replace every two years.
- Brake hoses: Replace every four years.
PERIODIC MAINTENANCE AND MINOR REPAIR

Drive chain slack
The drive chain slack should be checked before each ride and adjusted if necessary.

To check the drive chain slack
1. Place the motorcycle on a level surface and hold it in an upright position.

NOTE: When checking and adjusting the drive chain slack, the motorcycle should be positioned straight up and there should be no weight on it.

2. Shift the transmission into the neutral position.
3. Move the rear wheel by pushing the motorcycle to locate the tightest portion of the drive chain, and then measure the drive chain slack as shown.

Drive chain slack:
20.0–25.0 mm (0.79–0.98 in)

4. If the drive chain slack is incorrect, adjust it as follows.

To adjust the drive chain slack
1. Loosen the axle nut and the lock-nut on each side of the swingarm.
2. To tighten the drive chain, turn the adjusting bolt on each side of the swingarm in direction (a). To loosen the drive chain, turn the adjusting bolt on each side of the swingarm in direction (b), and then push the rear wheel forward.

NOTE: Using the alignment marks on each side of the swingarm, make sure that both chain pullers are in the same position for proper wheel alignment.

CAUTION: Improper drive chain slack will overload the engine as well as other vital parts of the motorcycle and can lead to chain slippage or breakage. To prevent this from occurring, keep the drive chain slack within the specified limits.
3. Tighten the locknuts, then the axle nut to their specified torques.

**Lubricating the drive chain**

The drive chain must be cleaned and lubricated at the intervals specified in the periodic maintenance and lubrication chart, otherwise it will quickly wear out, especially when riding in dusty or wet areas. Service the drive chain as follows.

**CAUTION:**

The drive chain must be lubricated after washing the motorcycle and riding in the rain.

1. Clean the drive chain with kerosene and a small soft brush.

**CAUTION:**

To prevent damaging the O-rings, do not clean the drive chain with steam cleaners, high-pressure washers or inappropriate solvents.

2. Wipe the drive chain dry.
3. Thoroughly lubricate the drive chain with a special O-ring chain lubricant.

**CAUTION:**

Do not use engine oil or any other lubricants for the drive chain, as they may contain substances that could damage the O-rings.
CHECKING AND LUBRICATING THE CABLES
The operation of all control cables and the condition of the cables should be checked before each ride, and the cables and cable ends should be lubricated if necessary. If a cable is damaged or does not move smoothly, have a Yamaha dealer check or replace it.

Recommended lubricant:
Engine oil

WARNING
Damage to the outer sheath may interfere with proper cable operation and will cause the inner cable to rust. Replace a damaged cable as soon as possible to prevent unsafe conditions.

CHECKING AND LUBRICATING THE THROTTLE GRIP AND CABLE
The operation of the throttle grip should be checked before each ride. In addition, the cable should be lubricated or replaced at the intervals specified in the periodic maintenance chart.

CHECKING AND LUBRICATING THE BRAKE AND CLUTCH LEVERS

Brake lever

Clutch lever

The operation of the brake and clutch levers should be checked before each ride, and the lever pivots should be lubricated if necessary.
Recommended lubricant:
Lithium-soap-based grease (all-purpose grease)

Checking and lubricating the sidestand

The operation of the sidestand should be checked before each ride, and the sidestand pivot and metal-to-metal contact surfaces should be lubricated if necessary.

⚠️ WARNING ⚠️
If the sidestand does not move up and down smoothly, have a Yamaha dealer check or repair it.

Recommended lubricant:
Lithium-soap-based grease (all-purpose grease)

Lubricating the swingarm pivots

The swingarm pivots must be lubricated at the intervals specified in the periodic maintenance and lubrication chart.

Recommended lubricant:
Lithium-soap-based grease
PERIODIC MAINTENANCE AND MINOR REPAIR

Checking the front fork
The condition and operation of the front fork must be checked as follows at the intervals specified in the periodic maintenance and lubrication chart.

To check the condition

⚠️ WARNING ⚠️
Securely support the vehicle so that there is no danger of it falling over.

Check the inner tubes for scratches, damage and excessive oil leakage

To check the operation

1. Place the vehicle on a level surface and hold it in an upright position
2. While applying the front brake, push down hard on the handlebars several times to check if the front fork compresses and rebounds smoothly

⚠️ CAUTION ⚠️
If any damage is found or the front fork does not operate smoothly, have a Yamaha dealer check or repair it.

Checking the steering
Worn or loose steering bearings may cause danger. Therefore, the operation of the steering must be checked as follows at the intervals specified in the periodic maintenance and lubrication chart.

1. Place a stand under the engine to raise the front wheel off the ground.

⚠️ WARNING ⚠️
Securely support the vehicle so that there is no danger of it falling over.

2. Hold the lower ends of the front fork legs and try to move them forward and backward. If any free play can be felt, have a Yamaha dealer check or repair the steering.
Checking the wheel bearings
The front and rear wheel bearings must be checked at the intervals specified in the periodic maintenance and lubrication chart. If there is play in the wheel hub or if the wheel does not turn smoothly, have a Yamaha dealer check the wheel bearings.

Battery
1. Negative battery terminal
2. Battery
3. Positive battery terminal

This model is equipped with a sealed-type (MF) battery, which does not require any maintenance. There is no need to check the electrolyte or to add distilled water.

To charge the battery
Have a Yamaha dealer charge the battery as soon as possible if it seems to have discharged. Keep in mind that the battery tends to discharge more quickly if the vehicle is equipped with optional electrical accessories.
**WARNING**

- Electrolyte is poisonous and dangerous since it contains sulfuric acid, which causes severe burns. Avoid any contact with skin, eyes or clothing and always shield your eyes when working near batteries. In case of contact, administer the following FIRST AID.
  - EXTERNAL: Flush with plenty of water.
  - INTERNAL: Drink large quantities of water or milk and immediately call a physician.
  - EYES: Flush with water for 15 minutes and seek prompt medical attention.
- Batteries produce explosive hydrogen gas. Therefore, keep sparks, flames, cigarettes, etc., away from the battery and provide sufficient ventilation when charging it in an enclosed space.

**KEEP THIS AND ALL BATTERIES OUT OF THE REACH OF CHILDREN.**

**To store the battery**

1. If the vehicle will not be used for more than one month, remove the battery, fully charge it, and then place it in a cool, dry place.
2. If the battery will be stored for more than two months, check it at least once a month and fully charge it if necessary.
3. Fully charge the battery before installation.
4. After installation, make sure that the battery leads are properly connected to the battery terminals.

**CAUTION**

- Always keep the battery charged. Storing a discharged battery can cause permanent battery damage.
- To charge a sealed-type (MF) battery, a special (constant-voltage) battery charger is required. Using a conventional battery charger will damage the battery. If you do not have access to a sealed-type (MF) battery charger, have a Yamaha dealer charge your battery.
Replacing the fuses

The main fuse and the electronic fuel injection fuse are located under the rider seat (See page 3-18).

6 Turn the key to "ON" and turn on the electrical circuit in question to check if the device operates  
7 If the fuse immediately blows again, have a Yamaha dealer check the electrical system.
8. Place the cowling in its original position, and then install and tighten the quick fastener screws.

NOTE: Make sure that the projections are inserted into the slots.

9. Install the quick fasteners.

NOTE: To install a quick fastener, push its pin back so that it protrudes from the fastener head, then insert the fastener and push the protruding pin in until it is flush with the fastener head.

**Supporting the motorcycle**
Since this model is not equipped with a centerstand, follow these precautions when removing the front and rear wheel or performing other maintenance requiring the motorcycle to stand upright. Check that the motorcycle is in a stable and level position before starting any maintenance. A strong wooden box can be placed under the engine for added stability.

**To service the front wheel**
1. Stabilize the rear of the motorcycle by using a motorcycle stand or, if an additional motorcycle stand is not available, by placing a jack under the frame in front of the rear wheel.
2. Raise the front wheel off the ground by using a motorcycle stand.

Troubleshooting

Although Yamaha motorcycles receive a thorough inspection before shipment from the factory, trouble may occur during operation. Any problem in the fuel, compression, or ignition systems, for example, can cause poor starting and loss of power.

The following troubleshooting charts represent quick and easy procedures for checking these vital systems yourself. However, should your motorcycle require any repair, take it to a Yamaha dealer, whose skilled technicians have the necessary tools, experience, and know-how to service the motorcycle properly.

Use only genuine Yamaha replacement parts. Imitation parts may look like Yamaha parts, but they are often inferior, have a shorter service life and can lead to expensive repair bills.

Troubleshooting charts

Starting problems or poor engine performance

**WARNING**
Keep away open flames and do not smoke while checking or working on the fuel system.

1. Fuel

- **Check the fuel level in the fuel tank**
  - There is enough fuel → Check the compression
  - There is no fuel → Supply fuel → The engine does not start
    - Check the compression

2. Compression

- **Operate the electric starter**
  - There is compression → Check the ignition
  - There is no compression → Have a Yamaha dealer check the vehicle

3. Ignition

- **Remove the spark plugs and check the electrodes**
  - Wet → Wipe off with a dry cloth and correct the spark plug gaps, or replace the spark plugs → Open the throttle halfway and operate the electric starter
    - The engine does not start
      - Check the battery
  - Dry → Have a Yamaha dealer check the vehicle

4. Battery

- **Operate the electric starter**
  - The engine turns over quickly → The battery is good
    - The engine does not start
      - Have a Yamaha dealer check the vehicle
  - The engine turns over slowly → Check the battery lead connections, and charge the battery if necessary

Engine overheating

⚠️ WARNING ⚠️

- Do not remove the radiator cap when the engine and radiator are hot. Scalding hot fluid and steam may be blown out under pressure, which could cause serious injury. Be sure to wait until the engine has cooled.
- After removing the radiator cap retaining bolt, place a thick rag, like a towel, over the radiator cap, and then slowly rotate the cap counterclockwise to the detent to allow any residual pressure to escape. When the hissing sound has stopped, press down on the cap while turning it counterclockwise, and then remove the cap.

NOTE:
If coolant is not available, tap water can be temporarily used instead, provided that it is changed to the recommended coolant as soon as possible.
Care
While the open design of a motorcycle reveals the attractiveness of the technology, it also makes it more vulnerable. Rust and corrosion can develop even if high-quality components are used. A rusty exhaust pipe may go unnoticed on a car, however, it detracts from the overall appearance of a motorcycle. Frequent and proper care does not only comply with the terms of the warranty, but it will also keep your motorcycle looking good, extend its life and optimize its performance.

Before cleaning
1. Cover the muffler outlet with a plastic bag after the engine has cooled down.
2. Make sure that all caps and covers as well as all electrical couplers and connectors, including the spark plug caps, are tightly installed.
3. Remove extremely stubborn dirt, like oil burnt onto the crankcase, with a degreasing agent and a brush, but never apply such products onto seals, gaskets, sprockets, the drive chain and wheel axles. Always rinse the dirt and degreaser off with water.

Cleaning

CAUTION:
- Avoid using strong acidic wheel cleaners, especially on spoked wheels. If such products are used on hard-to-remove dirt, do not leave the cleaner on the affected area any longer than instructed. Also, thoroughly rinse the area off with water, immediately dry it, and then apply a corrosion protection spray.
- Improper cleaning can damage windshields, cowlings, panels, other plastic parts, and the muffler. Use only a soft, clean cloth or sponge with mild detergent and water to clean plastic. However, if the muffler cannot be thoroughly cleaned with mild detergent, alkaline products and a soft brush may be used.

- Do not use any harsh chemical products on plastic parts or the muffler. Be sure to avoid using cloths or sponges which have been in contact with strong or abrasive cleaning products, solvent or thinner, fuel (gasoline), rust removers or inhibitors, brake fluid, antifreeze or electrolyte.
- Do not use high-pressure washers or steam-jet cleaners since they cause water seepage and deterioration in the following areas: seals (of wheel and swing-arm bearings, fork and brakes), storage compartments, electric components (couplers, connectors, instruments, switches and lights), breather hoses and vents.
- For motorcycles equipped with a windshield: Do not use strong cleaners or hard sponges as they will cause dulling or scratching. Some cleaning compounds for plastic may leave scratches on the windshield. Test the product on a small hid-
MOTORCYCLE CARE AND STORAGE

den part of the windshield to make sure that it does not leave any marks. If the windshield is scratched, use a quality plastic polishing compound after washing.

NOTE: Salt sprayed on roads in the winter may remain well into spring.

1. Clean the motorcycle with cold water and a mild detergent, after the engine has cooled down.

CAUTION: Do not use warm water since it increases the corrosive action of the salt.

2. After drying the motorcycle, apply a corrosion protection spray on all metal, including chrome- and nickel-plated, surfaces (except the titanium muffler) to prevent corrosion.

Cleaning the titanium muffler
This model is equipped with a titanium muffler, which requires the following special care.

- Use only a soft, clean cloth or sponge with mild detergent and water to clean the titanium muffler. However, if the muffler cannot be thoroughly cleaned with mild detergent, alkaline products and a soft brush may be used.
- Never use compounds or other special treatments to clean the titanium muffler, as they will remove the finish on the outer surface of the muffler.
- Even the smallest amounts of oil, such as from oily towels or fingerprints, will leave stains on the titanium muffler, which can be removed with a mild detergent.
- Note that the thermally induced discoloring of the portion of the exhaust pipe leading into the titanium muffler is normal and cannot be removed.

After cleaning
1. Dry the motorcycle with a chamois or an absorbing cloth.
2. Immediately dry the drive chain and lubricate it to prevent it from rusting.
3. Use a chrome polish to shine chrome, aluminum and stainless-steel parts.

After normal use
Remove dirt with warm water, a mild detergent, and a soft, clean sponge, and then rinse thoroughly with clean water. Use a toothbrush or bottlebrush for hard-to-reach areas. Stubborn dirt and insects will come off more easily if the area is covered with a wet cloth for a few minutes before cleaning.

After riding in the rain, near the sea or on salt-sprayed roads
Since sea salt or salt sprayed on roads during winter are extremely corrosive in combination with water, carry out the following steps after each ride in the rain, near the sea or on salt-sprayed roads.
4. To prevent corrosion, it is recommended to apply a corrosion protection spray on all metal, including chrome- and nickel-plated, surfaces.

5. Use spray oil as a universal cleaner to remove any remaining dirt.

6. Touch up minor paint damage caused by stones, etc.

7. Wax all painted surfaces.

8. Let the motorcycle dry completely before stowing or covering it.

**WARNING**

- Make sure that there is no oil or wax on the brakes or tires.
- If necessary, clean the brake discs and brake linings with a regular brake disc cleaner or acetone, and wash the tires with warm water and a mild detergent. Before riding at higher speeds, test the motorcycle's braking performance and cornering behavior.

**CAUTION**

- Apply spray oil and wax sparingly and make sure to wipe off any excess.
- Never apply oil or wax to any rubber and plastic parts, but treat them with a suitable product.
- Avoid using abrasive polishing compounds as they will wear away the paint.

**NOTE:** Consult a Yamaha dealer for advice on what products to use.

**Storage**

**Short-term**
Always store your motorcycle in a cool, dry place and, if necessary, protect it against dust with a porous cover.

**CAUTION**

- Storing the motorcycle in a poorly ventilated room or covering it with a tarp, while it is still wet, will allow water and humidity to seep in and cause rust.
- To prevent corrosion, avoid damp cellars, stables (because of the presence of ammonia) and areas where strong chemicals are stored.

**Long-term**
Before storing your motorcycle for several months:

1. Follow all the instructions in the “Care” section of this chapter.
2. Fill up the fuel tank and add fuel stabilizer (if available) to prevent the fuel tank from rusting and the fuel from deteriorating.
3. Perform the following steps to protect the cylinders, piston rings, etc from corrosion
   a. Remove the spark plug caps and spark plugs
   b. Pour a teaspoonful of engine oil into each spark plug bore
   c. Install the spark plug caps onto the spark plugs, and then place the spark plugs on the cylinder head so that the electrodes are grounded. (This will limit sparking during the next step.)
   d. Turn the engine over several times with the starter (This will coat the cylinder walls with oil)
   e. Remove the spark plug caps from the spark plugs, and then install the spark plugs and the spark plug caps

**WARNING**

To prevent damage or injury from sparking, make sure to ground the spark plug electrodes while turning the engine over.

---

4. Lubricate all control cables and the pivoting points of all levers and pedals as well as of the sidestand/centerstand.

5. Check and, if necessary, correct the tire air pressure, and then lift the motorcycle so that both of its wheels are off the ground. Alternatively, turn the wheels a little every month in order to prevent the tires from becoming degraded in one spot.

6. Cover the muffler outlets with plastic bags to prevent moisture from entering them.

7. Remove the battery and fully charge it. Store it in a cool, dry place and charge it once a month. Do not store the battery in an excessively cold or warm place (less than 0 °C (30 °F) or more than 30 °C (90 °F)). For more information on storing the battery, see page 6-28
