FOREWORD
INTRODUCTION
Congratulations on your purchase of a Yamaha WR series. This model is the culmination of Yamaha's vast experience in the production of pacesetting racing machines. It represents the highest grade of craftsmanship and reliability that have made Yamaha a leader.

This manual explains operation, inspection, basic maintenance and tuning of your machine. If you have any questions about this manual or your machine, please contact your Yamaha dealer.

For Canada
The design and manufacture of this Yamaha machine fully comply with the emissions standards for clean air applicable at the date of manufacture. Yamaha has met these standards without reducing the performance or economy of operation of the machine. To maintain these high standards, it is important that you and your Yamaha dealer pay close attention to the recommended maintenance schedules and operating instructions contained within this manual.

TIP
Yamaha continually seeks advancements in product design and quality. Therefore, while this manual contains the most current product information available at the time of printing, there may be minor discrepancies between your machine and this manual. If you have any questions concerning this manual, please consult your Yamaha dealer.

IMPORTANT MANUAL INFORMATION
Particularly important information is distinguished in this manual by the following notations.

⚠️ This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

⚠️ WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

WARNING A NOTICE indicates special precautions that must be taken to avoid damage to the vehicle or other property.

TIP A TIP provides key information to make procedures easier or clearer.

SAFETY INFORMATION
For Canada
This machine is designed for off-road use only. It is illegal for this machine to be operated on any public street, road, or highway. Off-road use on public lands may be illegal. Please check local regulations before riding.

Except for Canada
THIS MACHINE IS DESIGNED STRICTLY FOR COMPETITION USE. ONLY ON A CLOSED COURSE. It is illegal for this machine to be operated on any public street, road, or highway. Off-road use on public lands may also be illegal. Please check local regulations before riding.

For safety and reliability, the machine must be properly maintained. Always perform the pre-operation checks indicated in this manual. Correcting a mechanical problem before you ride may prevent an accident.

• GASOLINE IS HIGHLY FLAMMABLE.
Always turn off the engine while refueling. Take care to not spill any gasoline on the engine or exhaust system. Never refuel in the vicinity of an open flame, or while smoking.

• GASOLINE CAN CAUSE INJURY.
If you should swallow some gasoline, inhale excess gasoline vapors, or allow any gasoline to get into your eyes, contact a doctor immediately. If any gasoline spills onto your skin or clothing, immediately wash skin areas with soap and water, and change your clothes.

• ONLY OPERATE THE MACHINE IN AN AREA WITH ADEQUATE VENTILATION.
Never start the engine or let it run for any length of time in an enclosed area. Exhaust fumes are poisonous. These fumes contain carbon monoxide, which by itself is odorless and colorless. Carbon monoxide is a dangerous gas which can cause unconsciousness or can be lethal.

• PARK THE MACHINE CAREFULLY; TURN OFF THE ENGINE.
Always turn off the engine if you are going to leave the machine. Do not park the machine on a slope or soft ground as it may fall over.

• THE ENGINE, EXHAUST PIPE, MUFFLER, AND OIL TANK WILL BE VERY HOT AFTER THE ENGINE HAS BEEN RUN. Be careful not to touch them or to allow any clothing item to contact them during inspection or repair.

• ALWAYS WEAR PROTECTIVE APPAREL.
When operating this machine, always wear an approved helmet with goggles or a face shield. Also wear heavy boots, gloves, and protective clothing. Always wear proper fitting clothing that will not be caught in any of the moving parts or controls of the machine.

• ALWAYS MAINTAIN YOUR MACHINE IN PROPER WORKING ORDER.

PLEASE READ THIS MANUAL CAREFULLY AND COMPLETELY BEFORE OPERATING THIS MACHINE. DO NOT ATTEMPT TO OPERATE THIS MACHINE UNTIL YOU HAVE ATTAINED A SATISFACTORY KNOWLEDGE OF ITS CONTROLS AND OPERATING FEATURES AND UNTIL YOU HAVE BEEN TRAINED IN SAFE AND PROPER RIDING TECHNIQUES. REGULAR INSPECTIONS AND CAREFUL MAINTENANCE, ALONG WITH GOOD RIDING SKILLS, WILL ENSURE THAT YOU SAFELY ENJOY THE CAPABILITIES AND THE RELIABILITY OF THIS MACHINE.
• PROPERLY SECURE THE MACHINE BEFORE TRANSPORTING IT.
When transporting the machine in another vehicle, always be sure it is properly secured and in an upright position and that the fuel cock is in the “OFF” position. Otherwise, fuel may leak out of the carburetor or fuel tank.

HOW TO USE THIS MANUAL
FINDING THE REQUIRED PAGE
1. This manual consists of seven chapters; “General Information”, “Specifications”, “Regular inspection and adjustments”, “Tuning”, “Engine”, “Chassis” and “Electrical”.
2. The table of contents is at the beginning of the manual. Look over the general layout of the book before finding then required chapter and item.
Bend the book at its edge, as shown, to find the required fore edge symbol mark and go to a page for required item and description.

MANUAL FORMAT
All of the procedures in this manual are organized in a sequential, step-by-step format. The information has been complied to provide the mechanic with an easy to read, handy reference that contains comprehensive explanations of all disassembly, repair, assembly, and inspection operations.
In this revised format, the condition of a faulty component will precede an arrow symbol and the course of action required will follow the symbol, e.g.,
• Bearings
  Pitting/damage → Replace.
HOW TO READ DESCRIPTIONS
To help identify parts and clarify procedure steps, there are exploded diagrams at the start of each removal and disassembly section.

1. An easy-to-see exploded diagram “1” is provided for removal and disassembly jobs.

2. Numbers “2” are given in the order of the jobs in the exploded diagram. A number that is enclosed by a circle indicates a disassembly step.

3. An explanation of jobs and notes is presented in an easy-to-read way by the use of symbol marks “3”. The meanings of the symbol marks are given on the next page.

4. A job instruction chart “4” accompanies the exploded diagram, providing the order of jobs, names of parts, notes in jobs, etc.

5. For jobs requiring more information, the step-by-step format supplements “5” are given in addition to the exploded diagram and job instruction chart.

ILLUSTRATED SYMBOLS
Illustrated symbols “1” to “7” are used to identify the specifications appearing in the text.

1. With engine mounted
2. Filling fluid
3. Lubricant
4. Special tool
5. Tightening
6. Specified value, Service limit
7. Resistance (Ω), Voltage (V), Electric current (A)

Illustrated symbols “8” to “13” in the exploded diagrams indicate grade of lubricant and location of lubrication point.

8. Apply engine oil
9. Apply molybdenum disulfide oil
10. Apply brake fluid
11. Apply lightweight lithium-soap base grease
12. Apply molybdenum disulfide grease
13. Apply silicone grease

Illustrated symbols “14” to “15” in the exploded diagrams indicate where to apply a locking agent and where to install new parts.

14. Apply locking agent (LOC-TITE®)
15. Use new one

Improper tire pressure can cause loss of control.

Loss of control can result in severe injury or death.
The machine you have purchased may differ slightly from those shown in the following.

Designs and specifications are subject to change without notice.
CONSUMER INFORMATION

There are two significant reasons for knowing the serial number of your machine:

1. When ordering parts, you can give the number to your Yamaha dealer for positive identification of the model you own.
2. If your machine is stolen, the authorities will need the number to search for and identify your machine.

VEHICLE IDENTIFICATION NUMBER
The vehicle identification number "1" is stamped on the right of the steering head pipe.

ENGINE SERIAL NUMBER
The engine serial number "1" is stamped into the elevated part of the right-side of the engine.

MODEL LABEL
The model label "1" is affixed to the frame under the rider's seat. This information will be needed to order spare parts.

VEHICLE EMISSION CONTROL INFORMATION LABEL (For Canada)
The Vehicle Emission Control Information label "1" is affixed at the location in the illustration. This label shows specifications related to exhaust emissions as required by federal law, state law and Environment Canada.

INCLUDED PARTS

VALVE JOINT
This valve joint "1" prevents fuel from flowing out and is installed to the fuel tank breather hose.

A. Left
B. Right

SPARK PLUG WRENCH
This spark plug wrench "1" is used to remove and install the spark plug.

NIPPLE WRENCH
This nipple wrench "1" is used to tighten the spoke.

JET NEEDLE PULL-UP TOOL
(Except for Canada)
The jet needle pull-up tool "1" is used to pull the jet needle out of the carburetor.

DRIVE CHAIN SPROCKET GUIDE
(For EUROPE)
Use the drive chain sprocket guide "1" when installing the included drive sprocket (13T).

IMPORTANT INFORMATION
PREPARATION FOR REMOVAL AND DISASSEMBLY

1. Remove all dirt, mud, dust, and foreign material before removal and disassembly.
   • When washing the machine with high pressured water, cover the parts follows.
     Silencer exhaust port
     Side cover air intake port
     Water pump housing hole at the bottom
     Drain hole on the cylinder head (right side)
     All electrical components

2. Use proper tools and cleaning equipment. Refer to "SPECIAL TOOLS" section.
3. When disassembling the machine, keep mated parts together. They include gears, cylinders, pistons, and other mated parts that have been "mated" through normal wear. Mated parts must be reused as an assembly or replaced.

4. During the machine disassembly, clean all parts and place them in trays in the order of disassembly. This will speed up assembly time and help assure that all parts are correctly reinstalled.

5. Keep away from fire.

ALL REPLACEMENT PARTS
1. We recommend to use Yamaha genuine parts for all replacements. Use oil and/or grease recommended by Yamaha for assembly and adjustment.

GASKETS, OIL SEALS AND O-RINGS
1. All gaskets, oil seals, and O-rings should be replaced when an engine is overhauled. All gasket surfaces, oil seal lips, and O-rings must be cleaned.
2. Properly oil all mating parts and bearings during reassembly. Apply grease to the oil seal lips.

LOCK WASHERS/PLATES AND COTTER PINS
1. All lock washers/plates “1” and cotter pins must be replaced when they are removed. Lock tab(s) should be bent along the bolt or nut flat(s) after the bolt or nut has been properly tightened.

BEARINGS AND OIL SEALS
1. Install the bearing(s) “1” and oil seal(s) “2” with their manufacturer’s marks or numbers facing outward. (In other words, the stamped letters must be on the side exposed to view.) When installing oil seal(s), apply a light coating of lightweight lithium base grease to the seal lip(s). Oil the bearings liberally when installing.

**NOTICE**
Do not use compressed air to spin the bearings dry. This causes damage to the bearing surfaces.

CIRCLIPS
1. All circlips should be inspected carefully before reassembly. Always replace piston pin clips after one use. Replace distorted circlips. When installing a circlip “1”, make sure that the sharp-edged corner “2” is positioned opposite to the thrust “3” it receives. See the sectional view.

CHECKING OF CONNECTION
Dealing with stains, rust, moisture, etc. on the connector.
1. Disconnect:
   • Connector
2. Dry each terminal with an air blower.

3. Connect and disconnect the connector two or three times.
4. Pull the lead to check that it will not come off.
5. If the terminal comes off, bend up the pin “1” and reinsert the terminal into the connector.

6. Connect:
   • Connector

**TIP**
The two connectors "click" together.

7. Check for continuity with a tester.

**TIP**
• If there is no continuity, clean the terminals.
• Be sure to perform the steps 1 to 7 listed above when checking the wire harness.
• For a field remedy, use a contact revitalizer available on the market.
• Use the tester on the connector as shown.
The proper special tools are necessary for complete and accurate tune-up and assembly. Using the correct special tool will help prevent damage caused by the use of improper tools or improvised techniques. The shape and part number used for the special tool differ by country, so two types are provided. Refer to the list provided to avoid errors when placing an order.

**TIP**
- For U.S.A. and Canada, use part number starting with "YM-", "YU-" or "ACC-".
- For others, use part number starting with "90890-".

CONTROL FUNCTIONS

MAIN SWITCH
Functions of the respective switch positions are as follows:
ON:
The engine can be started only at this position.
OFF:
All electrical circuits are switched off.

Main switch indicator light
The main switch "1" is equipped with an indicator light "2" to avoid forgetting to turn it off. This light functions as follows.
• It lights up with the main switch "ON".
• It goes out when the engine increases its speed after being started.
• It lights up again when the engine is stopped.

TIP
If the indicator light will not light up with the main switch "ON", it shows a lack of the battery voltage. Recharge the battery.

ENGINE STOP SWITCH
The engine stop switch "1" is located on the left handlebar. Continue pushing the engine stop switch till the engine comes to a stop.

START SWITCH
The start switch "1" is located on the right handlebar. Push this switch to crank the engine with the starter.

CLUTCH LEVER
The clutch lever "1" is located on the left handlebar; it disengages or engages the clutch. Pull the clutch lever to the handlebar to disengage the clutch, and release the lever to engage the clutch. The lever should be pulled rapidly and released slowly for smooth starts.

SHIFT PEDAL
The gear ratios of the constant-mesh 5 speed transmission are ideally spaced. The gears can be shifted by using the shift pedal "1" on the left side of the engine.

KICKSTARTER CRANK
Rotate the kickstarter crank "1" away from the engine. Push the starter down lightly with your foot until the gears engage, then kick smoothly and forcefully to start the engine. This model has a primary kickstarter crank so the engine can be started in any gear if the clutch is disengaged. In normal practices, however, shift to neutral before starting.

THROTTLE GRIP
The throttle grip "1" is located on the right handlebar; it accelerates or decelerates the engine. For acceleration, turn the grip toward you; for deceleration, turn it away from you.

FUEL COCK
The fuel cock supplies fuel from the tank to carburetor and also filters the fuel. The fuel cock has the three positions:
OFF:
With the lever in this position, fuel will not flow. Always return the lever to this position when the engine is not running.
ON:
With the lever in this position, fuel flows to the carburetor. Normal riding is done with the lever in this position.
RES:
With the lever in this position fuel flows to the carburetor from the reserve section of the fuel tank after the main supply of the fuel has been depleted. Normal riding is possible with the lever is in this position, but it is recommended to add fuel as soon as possible.

FRONT BRAKE LEVER
The front brake lever "1" is located on the right handlebar. Pull it toward the handlebar to activate the front brake.

REAR BRAKE PEDAL
The rear brake pedal "1" is located on the right side of the machine. Press down on the brake pedal to activate the rear brake.
COLD STARTER KNOB
When cold, the engine requires a richer air-fuel mixture for starting. A separate starter circuit, which is controlled by the cold starter knob "1", supplies this mixture. Pull the cold starter knob out to open the circuit for starting. When the engine has warmed up, push it in to close the circuit.

HOT STARTER LEVER
The hot starter lever "1" is used when starting a warm engine. Use the hot starter lever when starting the engine again immediately after it was stopped (the engine is still warm). Pulling the hot starter lever injects secondary air to thin the air-fuel mixture temporarily, allowing the engine to be started more easily.

SIDESTAND
This sidestand "1" is used to support only the machine when standing or transporting it.

WARNING
• Never apply additional force to the sidestand.
• Hold up the sidestand before starting out.

MULTI-FUNCTION DISPLAY

**STARTING AND BREAK-IN**

**FUEL**
Always use the recommended fuel as stated below. Also, be sure to use new gasoline.

| Recommended fuel: Premium unleaded gasoline only with a research octane number of 95 or higher. |

**NOTICE**
Use only unleaded gasoline. The use of leaded gasoline will cause severe damage to the engine internal parts such as valves, piston rings, and exhaust system, etc.

**WARNING**
- For refueling, be sure to stop the engine and use enough care not to spill any fuel. Also be sure to avoid refueling close to a fire.
- Refuel after the engine, exhaust pipe, etc. have cooled off.

**Gasohol (For Canada)**
There are two types of gasohol: gasohol containing ethanol and that containing methanol. Gasohol containing ethanol can be used if the ethanol content does not exceed 10%. Gasohol containing methanol is not recommended by Yamaha because it can cause damage to the fuel system or vehicle performance problems.

**HANDLING NOTE**

**WARNING**
- Never start or run the engine in a closed area. The exhaust fumes are poisonous; they can cause loss of consciousness and death in a very short time. Always operate the machine in a well-ventilated area.

---

**NOTICE**
- The carburetor on this machine has a built-in accelerator pump. Therefore, when starting the engine, do not operate the throttle or the spark plug will foul.
- Unlike a two-stroke engine, this engine cannot be kick started when the throttle is open because the kickstarter may kick back. Also, if the throttle is open the air/fuel mixture may be too lean for the engine to start.
- Before starting the machine, perform the checks in the pre-operation check list.

**AIR FILTER MAINTENANCE**
According to "CLEANING THE AIR FILTER ELEMENT" section in the CHAPTER 3, apply the foam-air-filter oil or its equivalent to the element. (Excess oil in the element may adversely affect engine starting.)

**STARTING A COLD ENGINE**

**TIP**
This model is equipped with an ignition circuit cut-off system. The engine can be started under the following conditions.
- When the transmission is in neutral.
- When the clutch is disengaged with the transmission in any position. However, it is recommended to shift into neutral before starting the engine.

1. Inspect the coolant level.
2. Turn the fuel cock to "ON".
3. Push on the main switch to "ON".
4. Shift the transmission into neutral.
5. Fully open the cold starter knob "1".
6. Start the engine by pushing the start switch or by kicking the kickstarter crank.

---

**TIP**
If the engine fails to start by pushing the start switch, release the switch, wait a few seconds, and then try again. Each starting attempt should be as short as possible to preserve the battery. Do not crank the engine more than 10 seconds on any one attempt. If the engine does not start with the starter motor, try using the kickstarter crank.

**WARNING**
- If the starter motor will not turn when pushing the start switch, stop pushing it immediately and kick start the engine in order to avoid the load on the motor.
- Do not open the throttle while kicking the kickstarter crank. Otherwise, the kickstarter crank may kick back.

7. Return the cold starter knob to its original position and run the engine at 3,000–5,000 r/min for 1 or 2 minutes.

**TIP**
Since this model is equipped with an accelerator pump, if the engine is raced (the throttle opened and closed), the air/fuel mixture will be too rich and the engine may stall. Also unlike a two-stroke engine, this model can idle.

**NOTICE**
Do not warm up the engine for extended periods of time.

**STARTING A WARM ENGINE**
Do not operate the cold starter knob and throttle. Pull the hot starter lever "1" and start the engine by pushing the start switch or by kicking the kickstarter crank forcefully with a firm stroke. As soon as the engine starts, Release the hot starter lever to close the air passage.

---

Recommended fuel: Premium unleaded gasoline only with a research octane number of 95 or higher.
STARTING AND BREAK-IN

**Restarting an engine after a fall**
Pull the hot starter lever and start the engine. As soon as the engine starts, release the hot starter lever to close the air passage.

**The engine fails to start**
Pull the hot starter lever all the way out and while holding the lever, kick the kickstarter crank 10 to 20 times to clear the engine. Then, restart the engine. Refer to “Restarting an engine after a fall”.

* Operate the throttle grip before kick starting.

**NOTICE**
Observe the following break-in procedures during initial operation to ensure optimum performance and avoid engine damage.

**BREAK-IN PROCEDURES**
1. Before starting the engine, fill the fuel tank with the fuel.
2. Perform the pre-operation checks on the machine.
3. Start and warm up the engine. Check the idle speed, and check the operation of the controls and the engine stop switch. Then, restart the engine and check its operation within no more than 5 minutes after it is restarted.
4. Operate the machine in the lower gears at moderate throttle openings for five to eight minutes.
5. Check how the engine runs when the machine is ridden with the throttle 1/4 to 1/2 open (low to medium speed) for about one hour.
6. Restart the engine and check the operation of the machine throughout its entire operating range. Restart the machine and operate it for about 10 to 15 more minutes.

**NOTICE**
After the break-in or before each ride, you must check the entire machine for loose fittings and fasteners as per "TORQUE-CHECK POINTS". Tighten all such fasteners as required.

CLEANING AND STORAGE

CLEANING
Frequent cleaning of your machine will enhance its appearance, maintain good overall performance, and extend the life of many components.

1. Before washing the machine, block off the end of the exhaust pipe to prevent water from entering. A plastic bag secured with a rubber band may be used for this purpose.
2. If the engine is excessively greasy, apply some degreaser to it with a paint brush. Do not apply degreaser to the chain, sprockets, or wheel axles.
3. Rinse the dirt and degreaser off with a garden hose; use only enough pressure to do the job.
4. After the majority of the dirt has been hosed off, wash all surfaces with warm water and a mild detergent. Use an old toothbrush to clean hard-to-reach places.
5. Rinse the machine off immediately with clean water, and dry all surfaces with a soft towel or cloth.
6. Immediately after washing, remove excess water from the chain with a paper towel and lubricate the chain to prevent rust.
7. Clean the seat with a vinyl upholstery cleaner to keep the cover pliable and glossy.
8. Automotive wax may be applied to all painted or chromed surfaces. Avoid combination cleaner-waxes, as they may contain abrasives.
9. After completing the above, start the engine and allow it to idle for several minutes.

STORAGE
If your machine is to be stored for 60 days or more, some preventive measures must be taken to avoid deterioration. After cleaning the machine thoroughly, prepare it for storage as follows:

1. Drain the fuel tank, fuel lines, and the carburetor float bowl.
2. Remove the spark plug, pour a tablespoon of SAE 10W-40 motor oil in the spark plug hole, and reinstall the plug. With the engine stop switch pushed in, kick the engine over several times to coat the cylinder walls with oil.
3. Remove the drive chain, clean it thoroughly with solvent, and lubricate it. Reinstall the chain or store it in a plastic bag tied to the frame.
4. Lubricate all control cables.
5. Block the frame up to raise the wheels off the ground.
6. Tie a plastic bag over the exhaust pipe outlet to prevent moisture from entering.
7. If the machine is to be stored in a humid or salt-air environment, coat all exposed metal surfaces with a film of light oil. Do not apply oil to rubber parts or the seat cover.

TIP
Make any necessary repairs before the machine is stored.

GENERAL TORQUE SPECIFICATIONS

This chart specifies torque for standard fasteners with standard I.S.O. pitch threads. Torque specifications for special components or assemblies are included in the applicable sections of this book. To avoid warpage, tighten multi-fastener assemblies in a crisscross fashion, in progressive stages, until full torque is reached. Unless otherwise specified, torque specifications call for clean, dry threads. Components should be at room temperature.

TIP
- The air filter needs more frequent service if you are riding in unusually wet or dusty areas.
- Hydraulic brake service
  - After disassembling the brake master cylinders and calipers, always change the fluid. Regularly check the brake fluid levels and fill the reservoirs as required.
  - Every two years replace the internal components of the brake master cylinders and calipers, and change the brake fluid.
- Replace the brake hoses every four years and if cracked or damaged.

MAINTENANCE INTERVALS FOR COMPETITION USE

TIP
- The following schedule is intended as a general guide to maintenance and lubrication. Bear in mind that such factors as weather, terrain, geographical location, and individual usage will alter the required maintenance and lubrication intervals. If you are a doubt as to what intervals to follow in maintaining and lubricating your machine, consult your Yamaha dealer.
- Periodic inspection is essential in making full use of the machine performance. The service life of the parts varies substantially according to the environment in which the machine runs (e.g., rain, dirt, etc.). Therefore, earlier inspection is required by reference to the list below.

CHECKING THE SILENCER AND EXHAUST PIPE

1. Inspect:
   • Gasket "1"
     Damage → Replace.

INSTALLING THE SILENCER AND EXHAUST PIPE

1. Install:
   • Gasket "1"
   • Exhaust pipe "1"
   • Nut (exhaust pipe) "2"

   **TIP**
   First, temporarily install both nuts, then tighten either of these nuts to 13 Nm (1.3 m•kg, 9.4 ft•lb) and the other to 20 Nm (2.0 m•kg, 14 ft•lb), and then come back to the first one and retighten it to 20 Nm (2.0 m•kg, 14 ft•lb).

2. Install:
   • Silencer clamp "1"
   • Gasket "2"
   • Silencer "3"
   • Washer "4"
   • Bolt (silencer) "5"

   **NOTE**
   Hard water or salt water is harmful to the engine parts. You may use distilled water, if you can’t get soft water.

CHECKING THE COOLANT LEVEL

1. Place the machine on a level place, and hold it in an upright position.
2. Remove:
   • Radiator cap
3. Check:
   • Coolant level "a"
     Coolant level low → Add coolant.

   **WARNING**
   Do not remove the radiator cap "1", drain bolt and hoses when the engine and radiator are hot. Scalding hot fluid and steam may be blown out under pressure, which could cause serious injury. When the engine has cooled, place a thick towel over the radiator cap, slowly rotate the cap counterclockwise to the detent. This procedure allows any residual pressure to escape. When the hissing sound has stopped, press down on the cap while turning counterclockwise and remove it.

   **NOTICE**
   Hard water or salt water is harmful to the engine parts. You may use distilled water, if you can’t get soft water.

ADJUSTING THE PILOT SCREW
(For EUROPE)
1. Adjust:
• Pilot screw "1"

Adjustment steps:

**TIP**
To optimize the fuel flow at a smaller throttle opening, each machine’s pilot screw has been individually set at the factory. Before adjusting the pilot screw, turn it in fully and count the number of turns. Record this number as the factory-set number of turns.

a. Turn in the pilot screw until it is lightly seated.
b. Turn out the pilot screw by the factory-set number of turns.

ADJUSTING THE ENGINE IDLING SPEED
1. Start the engine and thoroughly warm it up.
2. Adjust:
• Engine idling speed

Adjustment steps:
a. Turn the throttle stop screw "1" until the specified engine idling speed.

**TIP**
Using a digital engine tachometer for idle speed adjustment, detect the engine idling speed by bringing the sensing element "c" of the engine tachometer close to the ignition coil "2".

To increase idle speed — Turn the throttle stop screw "1" in "a".
To decrease idle speed — Turn the throttle stop screw "1" out "b".

Engine idling speed: 1,750–1,950 r/min

ADJUSTING THE VALVE CLEARANCE

**TIP**
This section is intended for those who have basic knowledge and skill concerning the servicing of Yamaha motorcycles (e.g., Yamaha dealers, service engineers, etc.). Those who have little knowledge and skill concerning servicing are requested not to undertake inspection, adjustment, disassembly, or reassembly only by reference to this manual. It may lead to servicing trouble and mechanical damage.

• The valve clearance should be adjusted when the engine is cool to the touch.
• The piston must be at Top Dead Center (T.D.C.) on compression stroke to check or adjust the valve clearance.

1. Remove:
• Seat
• Fuel tank
Refer to “SEAT, FUEL TANK AND SIDE COVERS” section.
2. Drain:
• Coolant
Refer to “CHANGING THE COOLANT” section.
3. Remove:
• Right radiator
Right to "RADIATOR" section in the CHAPTER 5.
• Carburetor
Refer to "CARBURETOR" section in the CHAPTER 5.
• Spark plug
• Upper engine bracket
• Cylinder head cover
Refer to "CAMSHAFTS" section in the CHAPTER 5.
4. Remove:
• Timing mark accessing screw "1"
• Crankshaft end accessing screw "2"
• O-ring

5. Check:
• Valve clearance Out of specification → Adjust.

**Valve clearance (cold):**
- Intake valve: 0.10–0.15 mm (0.0039–0.0059 in)
- Exhaust valve: 0.17–0.22 mm (0.0067–0.0087 in)

**Checking steps:**
a. Turn the crankshaft counterclockwise with a wrench.
b. Align the T.D.C. mark "a" on the rotor with the align mark "b" on the crankcase cover when piston is at T.D.C. on compression stroke.

**TIP**
In order to be sure that the piston is at Top Dead Center, the punch mark "c" on the exhaust camshaft and the punch mark "d" on the intake camshaft must align with the cylinder head surface, as shown in the illustration.

c. Measure the valve clearance "e" using a feeler gauge "1".

**TIP**
Record the measured reading if the clearance is incorrect.
6. Adjust:
   • Valve clearance

Adjustment steps:
   a. Remove the camshaft (intake and exhaust).
      Refer to "CAMSHAFTS" section in the CHAPTER 5.
   b. Remove the valve lifters "1" and the pads "2".

   TIP
   • Place a rag in the timing chain space to prevent pads from falling into the crankcase.
   • Identity each valve lifter and pad position very carefully so that they can be reinstalled in their original place.

   c. Select the proper pad using the pad selecting table.

<table>
<thead>
<tr>
<th>Pad range</th>
<th>Pad Availability: 25 increments</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. 120–240</td>
<td>1.20 mm–2.40 mm Pads are available in 0.05 mm increments</td>
</tr>
</tbody>
</table>

   d. Round off the last digit of the installed pad number to the nearest increment.

<table>
<thead>
<tr>
<th>Last digit of pad number</th>
<th>Rounded valve</th>
</tr>
</thead>
<tbody>
<tr>
<td>0, 1 or 2</td>
<td>0</td>
</tr>
<tr>
<td>4, 5 or 6</td>
<td>5</td>
</tr>
<tr>
<td>8 or 9</td>
<td>10</td>
</tr>
</tbody>
</table>

   EXAMPLE:
   Installed pad number = 148
   Rounded off value = 150

   TIP
   Pads can only be selected in 0.05 mm increments.

   e. Locate the rounded-off value and the measured valve clearance in the chart "PAD SELECTION TABLE". The field where these two coordinates intersect shows the new pad number to use.

   TIP
   Use the new pad number only as a guide when verifying the valve clearance adjustment.

   f. Install the new pads "3" and the valve lifters "4".

   TIP
   • Apply the engine oil on the valve lifters.
   • Apply the molybdenum disulfide oil on the valve stem ends.
   • Valve lifter must turn smoothly when rotated with a finger.
   • Be careful to reinstall valve lifters and pads in their original place.

   c. Turn each adjuster exactly the same amount to maintain correct axle alignment. (There are marks "a" on each side of the drive chain puller alignment.) NOTICE: Improper drive chain slack will overload the engine as well as other vital parts of the motorcycle and can lead to chain slippage or breakage. To prevent this from occurring, keep the drive chain slack within the specified limits.

   d. Tighten the axle nut while pushing down the drive chain.

   e. Tighten the locknuts.

ELECTRICAL

CHECKING THE SPARK PLUG
1. Remove:
   • Spark plug
2. Inspect:
   • Electrode "1"
     Wear/damage → Replace.
   • Insulator color "2"
     Normal condition is a medium to light tan color.
     Distinctly different color → Check the engine condition.

TIP
When the engine runs for many hours at low speeds, the spark plug insulator will become sooty, even if the engine and carburetor are in good operating condition.

3. Measure:
   • Plug gap "a"
     Use a wire gauge or thickness gauge.
     Out of specification → Regap.

4. Clean the plug with a spark plug cleaner if necessary.

CHECKING AND CHARGING THE BATTERY

**WARNING**
Batteries generate explosive hydrogen gas and contain electrolyte which is made of poisonous and highly caustic sulfuric acid. Therefore, always follow these preventive measures:
• Wear protective eye gear when handling or working near batteries.
• Charge batteries in a well-ventilated area.
• Keep batteries away from fire, sparks or open flames (e.g., welding equipment, lighted cigarettes).
• DO NOT SMOKE when charging or handling batteries.
• KEEP BATTERIES AND ELECTROLYTE OUT OF REACH OF CHILDREN.
• Avoid bodily contact with electrolyte as it can cause severe burns or permanent eye injury.

FIRST AID IN CASE OF BODILY CONTACT:
EXTERNAL
• Skin — Wash with water.
• Eyes — Flush with water for 15 minutes and get immediate medical attention.

INTERNAL
• Drink large quantities of water or milk followed with milk of magnesia, beaten egg or vegetable oil.
Get immediate medical attention.

**NOTICE**
Charging time, charging amperage and charging voltage for an MF battery are different from those of conventional batteries. The MF battery should be charged as explained in the charging method illustrations. If the battery is overcharged, the electrolyte level will drop considerably. Therefore, take special care when charging the battery.

**TIP**
Since MF batteries are sealed, it is not possible to check the charge state of the battery by measuring the specific gravity of the electrolyte. Therefore, the charge of the battery has to be checked by measuring the voltage at the battery terminals.
1. Remove:
   - Seat
2. Disconnect:
   - Battery leads
     (from the battery terminals)

**NOTICE**
First, disconnect the negative battery lead "1", and then the positive battery lead "2".

3. Remove:
   - Battery band
   - Battery
4. Measure:
   - Battery charge

**------------------------------------------------------------------------------------------------**
**Measurement steps:**
a. Connect a pocket tester "1" to the battery terminals.

**------------------------------------------------------------------------------------------------**

**Tester positive probe → battery positive terminal**
**Tester negative probe → battery negative terminal**

**TIP**
- The charge state of an MF battery can be checked by measuring its open-circuit voltage (i.e., the voltage when the positive terminal is disconnected).
- No charging is necessary when the open-circuit voltage equals or exceeds 12.8 V.

b. Check the charge of the battery, as shown in the charts and the following example.

**Example**
Open-circuit voltage = 12.0 V
Charging time = 6.5 hours
Charge of the battery = 20–30%

**------------------------------------------------------------------------------------------------**

**NOTICE**
- Never remove the MF battery sealing caps.
- Do not use a high-rate battery charger since it forces a high-amperage current into the battery quickly and can cause battery overheating and battery plate damage.
- If it is impossible to regulate the charging current on the battery charger, be careful not to overcharge the battery.
- When charging a battery, be sure to remove it from the machine. (If charging has to be done with the battery mounted on the machine, disconnect the negative battery lead from the battery terminal.)
- To reduce the chance of sparks, do not plug in the battery charger until the battery charger leads are connected to the battery.
- Before removing the battery charger lead clips from the battery terminals, be sure to turn off the battery charger.
- Make sure the battery charger lead clips are in full contact with the battery terminal and that they are not shorted. A corroded battery charger lead clip may generate heat in the contact area and a weak clip spring may cause sparks.
- If the battery becomes hot to the touch at any time during the charging process, disconnect the battery charger and let the battery cool before reconnecting it. Hot batteries can explode!
- As shown in the following illustration, the open-circuit voltage of an MF battery stabilizes about 30 minutes after charging has been completed. Therefore, wait 30 minutes after charging is completed before measuring the open-circuit voltage.
Charging method using a variable voltage charger

Measure the open-circuit voltage prior to charging.

Connect a charger and ammeter to the battery and start charging.

Is the amperage higher than the standard charging amperage written on the battery?

Adjust the voltage to obtain the standard charging amperage.

Set the timer to the charging time determined by the open-circuit voltage. Refer to “BATTERY INSPECTION AND CHARGING” section.

Adjust the charging voltage to 20 ~ 25 V.

Monitor the amperage for 3 ~ 5 minutes. Is the standard charging amperage exceeded?

If the amperage does not exceed the standard charging amperage after 5 minutes, replace the battery.

If the required charging time exceeds 5 hours, it is advisable to check the charging amperage after 5 hours. If there is any change in the amperage, readjust the voltage to obtain the standard charging amperage.

Leave the battery unused for more than 30 minutes before measuring its open-circuit voltage.

12.8 V → Charging is complete.
12.0 ~ 12.7 V → Recharging is required.
Under 12.0 V → Replace the battery.

NOTE:
Leave the battery unused for more than 30 minutes before measuring its open-circuit voltage.

NOTE:
Set the charging voltage to 16-17 V. (If the charging voltage is lower, charging will be insufficient, if it is higher, the battery will be over-charged.)
Charging method using a constant voltage charger

Measure the open-circuit voltage prior to charging.

Connect a charger and ammeter to the battery and start charging.

Is the amperage higher than the standard charging amperage written on the battery?

YES

Charge the battery until the charging voltage reaches 15 V.

NOTE: Set the charging time to a maximum of 20 hours.

Leave the battery unused for more than 30 minutes before measuring its open-circuit voltage.
12.8 V → Charging is complete.
12.0–12.7 V → Recharging is required.
Under 12.0 V → Replace the battery.

NOTE: Leave the battery unused for more than 30 minutes before measuring its open-circuit voltage.

NO

This type of battery charger cannot charge an MF battery. A variable voltage charger is recommended.

CAUTION: Constant amperage chargers are not suitable for charging MF batteries.

Never use a fuse with an amperage rating other than that specified. Improvising or using a fuse with the wrong amperage rating may cause extensive damage to the electrical system, cause the starting and ignition systems to malfunction and could possibly cause a fire.

4. Install:
   • Headlight bulb holder cover
   • Seat

**WARNING**
Since the headlight bulb gets extremely hot, keep flammable products and your hands away from the bulb unit it has cooled down.

5. Install:

**NOTICE**
Avoid touching the glass part of the headlight bulb to keep it free from oil, otherwise the transparency of the glass, the life of the bulb and the luminous flux will be adversely affected. If the headlight bulb gets soiled, thoroughly clean it with a cloth moistened with alcohol or lacquer thinner.

ENGINE (Except for Canada)
CARBURETOR SETTING
• The air/fuel mixture will vary depending on atmospheric conditions. Therefore, it is necessary to take into consideration the air pressure, ambient temperature, humidity, etc., when adjusting the carburetor.
• Perform a test run to check for proper engine performance (e.g., throttle response) and spark plug(s) discoloration or fouling. Use these readings to determine the best possible carburetor setting.

TIP
It is recommended to keep a record of all carburetor settings and external conditions (e.g., atmospheric conditions, track/surface conditions, lap times) to make future carburetor setting easier.

WARNING
• The carburetor is a part of the fuel line. Therefore, be sure to install it in a well-ventilated area, away from flammable objects and any sources of fire.
• Never look into the carburetor intake. Flames may shoot out from the pipe if the engine backfires while it is being started. Gasoline may be discharged from the accelerator pump nozzle when the carburetor has been removed.

NOTICE
• The carburetor is extremely sensitive to foreign matter (dirt, sand, water, etc.). During installation, do not allow foreign matter to get into the carburetor.
• Always handle the carburetor and its components carefully. Even slight scratches, bends or damage to carburetor parts may prevent the carburetor from functioning correctly. Carefully perform all servicing with the appropriate tools and without applying excessive force.
• When the engine is stopped or when riding at no load, do not open and close the throttle unnecessarily. Otherwise, too much fuel may be discharged, starting may become difficult or the engine may not run well.

CONSTRUCTION OF CARBURETOR AND SETTING PARTS
The FLATCR carburetor has a primary main jet. This type of main jet is perfect for racing machines since it supplies an even flow of fuel, even at full load. Use the main jet and the jet needle to set the carburetor.

ADJUSTING THE MAIN JET
The richness of the air-fuel mixture at full throttle can be set by changing the main jet

ADJUSTING THE PILOT JET
The richness of the air-fuel mixture with the throttle open 1/4 or less can be set by adjusting the pilot jet "1".

2. No.3 groove
3. No.4 groove

ADJUSTING THE JET NEEDLE GROOVE POSITION
Adjusting the jet needle "1" position affects the acceleration when the throttle is 1/8 to 3/4 open.

1. Too rich at intermediate speeds
   - Rough engine operation is felt and the engine will not pick up speed smoothly.
   - Step up the jet needle clip by one groove and move down the needle to lean out the mixture.

2. Too lean at intermediate speeds
   - The engine breathes hard and will not pick up speed quickly.
   - Step down the jet needle clip by one groove and move up the needle to enrich the mixture.

ADJUSTING THE LEAK JET (ADJUSTING THE ACCELERATOR PUMP)
The leak jet "1" is a setting part that adjusts the flow of fuel discharged by the accelerator pump. Since the accelerator pump operates only when throttle is open, the leak jet is used to adjust a fuel mixture ratio for quick throttle opening and is therefore different from other setting parts that adjust a fuel mixture for each throttle opening (each engine speed).

1. When the engine breathes hard in quick throttle opening, select a leak jet having lower calibrating No. than standard to enrich the mixture. <Example> #70 → #65
2. When rough engine operation is felt in quick throttle opening, select a leak jet having higher calibrating No. than standard to lean out the mixture. <Example> #70 → #85

| Standard leak jet | #70 |

RELATIONSHIP WITH THROTTLE OPENING
The flow of the fuel through the carburetor main system is controlled by the main jet and then, it is further regulated by the area between the main nozzle and the jet needle.

The fuel flow relates to the diameter of the straight portion of the jet needle with the throttle 1/8 to 1/4 open and relates to the clip position with the throttle 1/8 to 3/4 open.

Therefore, the fuel flow is balanced at each stage of throttle opening by the combination of the jet needle straight portion diameter and clip position.

* For EUROPE

<Requirement for selection of secondary gear reduction ratio>

- It is generally said that the secondary gear ratio should be reduced for a longer straight portion of a speed course and should be increased for a course with many corners. Actually, however, as the speed depends on the ground condition of the day of the ride, be sure to run through the circuit to set the machine suitable for the entire course.
- In actuality, it is very difficult to achieve settings suitable for the entire course and some settings may be sacrificed. Thus, the settings should be matched to the portion of the course that has the greatest effect on the ride result. In such a case, run through the entire course while making notes of lap times to find the best balance; then, determine the secondary reduction ratio.
- If a course has a long straight portion where a machine can run at maximum speed, the machine is generally set such that it can develop its maximum revolutions toward the end of the straight line, with care taken to avoid the engine over-revving.

TIP

Riding technique varies from rider to rider and the performance of a machine also vary from machine to machine. Therefore, do not imitate other rider's settings from the beginning but choose your own setting according to the level of your riding technique.

FRONT FORK SETTING

The front fork setting should be made depending on the rider's feeling of an actual run and the circuit conditions. The front fork setting includes the following three factors:

1. Setting of air spring characteristics
   - Change the fork oil level.
2. Setting of spring preload
   - Change the spring.
   - Install the adjustment washer.
3. Setting of damping force
   - Change the compression damping.
   - Change the rebound damping.
   - The spring acts on the load and the damping force acts on the cushion travel speed.

CHANGE IN LEVEL AND CHARACTERISTICS OF FORK OIL

Damping characteristic near the final stroke can be changed by changing the fork oil amount.

** NOTICE **

Adjust the oil level in 5 mm (0.2 in) increments or decrements. Too low oil level causes the front fork to produce a noise at full rebound or the rider to feel some pressure on his hands or body. Alternatively, too high oil level will develop unexpectedly early oil lock with the consequent shorter front fork travel and deteriorated performance and characteristics. Therefore, adjust the front fork within the specified range.

TIRE PRESSURE

Tire pressure should be adjust to suit the road surface condition of the circuit.

- Under a rainy, muddy, sandy, or slippery condition, the tire pressure should be lower for a larger area of contact with the road surface.
- Under a stony or hard road condition, the tire pressure should be higher to prevent a flat tire.

** NOTICE **

Standard tire pressure: 100 kPa (1.0 kgf/cm², 15 psi)

Extent of adjustment: 100–120 kPa (1.0–1.2 kgf/cm², 15–18 psi)

Standard oil level: 132 mm (5.20 in)

Extent of adjustment: 95–150 mm (3.74–5.91 in)

**ADJUSTING THE SPRING PRELOAD**
The spring preload is adjusted by installing the adjustment washer “1” between the fork spring “2” and damper rod “3”.

Do not install three or more adjustment washers for each front fork.

**WARNING**
Always adjust each front fork to the same setting. Uneven adjustment can cause poor handling and loss of stability.

**NOTICE**
Do not install three or more adjustment washers for each front fork.

**FRONT FORK SETTING PARTS**
- Adjustment washer “1”
  - Standard washer quantity:
    - Zero adjustment washers
  - Extent of adjustment:
    - Zero–2 adjustment washers

**REAR SUSPENSION SETTING**
The rear suspension setting should be made depending on the rider’s feeling of an actual run and the circuit conditions.
The rear suspension setting includes the following two factors:
1. Setting of spring preload
   - Change the set length of the spring.
2. Setting of damping force
   - Change the rebound damping.
   - Change the compression damping.
CHOOSING SET LENGTH
1. Place a stand or block under the engine to put the rear wheel above the floor, and measure the length "a" between the rear wheel axle center and the rear fender holding bolt.

2. Remove the stand or block from the engine and with a rider astride the seat, measure the sunken length "b" between the rear wheel axle center and the rear fender holding bolt.

3. Loosen the locknut "1" and make adjustment by turning the spring adjuster "2" to achieve the standard figure from the subtraction of the length "b" from the length "a".

Setting of Spring After Replacement
After replacement, be sure to adjust the spring to the set length [sunken length 90–100 mm (3.5–3.9 in)] and set it.

1. Use of soft spring
   • Set the soft spring for less rebound damping to compensate for its less spring load. Run with the rebound damping adjuster one or two clicks on the softer side and readjust it to suit your preference.

2. Use of stiff spring
   • Set the soft spring for more rebound damping to compensate for its greater spring load. Run with the rebound damping adjuster one or two clicks on the stiffer side and readjust it to suit your preference.

Tip
Adjusting the rebound damping will be followed more or less by a change in the compression damping. For correction, turn the low compression damping adjuster on the softer side.

Notice
When using a rear shock absorber other than currently installed, use the one whose overall length "a" does not exceed the standard as it may result in faulty performance. Never use one whose overall length is greater than standard.

TIP
• If the machine is new and after it is broken in, the same set length of the spring may change because of the initial fatigue, etc. of the spring. Therefore, be sure to make reevaluation.
• If the standard figure cannot be achieved by adjusting the spring adjuster and changing the spring set length, replace the spring with an optional one and make re-adjustment.

HANDLING NOTE

**WARNING**
Do not remove the radiator cap when the engine and radiator are hot. Scalding hot fluid and steam may be blown out under pressure, which could cause serious injury. When the engine has cooled, open the radiator cap by the following procedure:
Place a thick rag, like a towel, over the radiator cap, slowly rotate the cap counterclockwise to the detent. This procedure allows any residual pressure to escape. When the hissing sound has stopped, press down on the cap while turning counterclockwise and remove it.

CHECKING THE RADIATOR
1. Inspect:
   - Radiator core "1"
     Obstruction → Blow out with compressed air through rear of the radiator.
     Bent fin → Repair/replace.

2. Install:
   - Catch tank hose "1"
   - Radiator hose 2 "2"
   - Radiator hose 3 "3"
   - Radiator pipe 2 "4"
   - Radiator hose 5 "5"
   - Radiator hose 4 "6"

HANDLING NOTE

**NOTICE**
Do not loosen the screw (throttle position sensor) “1” except when changing the throttle position sensor due to failure because it will cause a drop in engine performance.

CHECKING THE CARBURETOR

1. Inspect:
   - Carburetor body
   - Contamination → Clean.

**TIP**
- Use a petroleum-based solvent for cleaning. Blow out all passages and jets with compressed air.
- Never use a wire.

CHECKING THE JET NEEDLE

1. Inspect:
   - Jet needle "1"
   - Bends/wear → Replace.
   - Clip groove
   - Free play exists/wear → Replace.

**TIP**

- Never use a wire.

MEASURING AND ADJUSTING THE FLOAT HEIGHT

1. Measure:
   - Float height "a"
   - Out of specification → Adjust.

   **Measurement and adjustment steps:**
   a. Hold the carburetor in an upside down position.
   **TIP**
   - Slowly tilt the carburetor in the opposite direction, then take the measurement when the needle valve aligns with the float arm.
   - If the carburetor is level, the weight of the float will push in the needle valve, resulting in an incorrect measurement.

   b. Measure the distance between the mating surface of the float chamber and top of the float using a vernier calipers.
   **TIP**
   - Insert the throttle valve "1" into the carburetor body, and check for free movement.

   c. If the float height is not within specification, inspect the valve seat and needle valve.
   d. If either is worn, replace them both.
5-8

CARBURETOR

e. If both are fine, adjust the float height by bending the float tab "b" on the float.

f. Recheck the float height.

deteriorate, causing leakage and
poor brake performance.
   • Refill with the same type of brake
     fluid;
mixing fluids may result in a
    harmful chemical reaction and
lead to poor performance.
   • Be careful that water does not
     enter the master cylinder when
refilling. Water will significantly
lower the boiling point of the flu-
    id and may result in vapor lock.

   **NOTICE**
Brake fluid may erode painted sur-
faces or plastic parts. Always
clean up spilled fluid immediately.

2. Air bleed:
   • Brake system

HANDLING NOTE

**WARNING**
Support the machine securely so there is no danger of it falling over.

**TIP**
The front fork requires careful attention. So it is recommended that the front fork be maintained at the dealers.

**NOTICE**
To prevent an accidental explosion of air, the following instructions should be observed:

- The front fork with a built-in piston rod has a very sophisticated internal construction and is particularly sensitive to foreign material. Use enough care not to allow any foreign material to come in when the oil is replaced or when the front fork is disassembled and reassembled.
- Before removing the cap bolts or front forks, be sure to extract the air from the air chamber completely.

**REMOVING THE FRONT FORK CAP BOLT**

1. Remove:
   - Front fork cap bolt "1" from the outer tube.

**TIP**
Before removing the front fork from the machine, loosen the front fork cap bolt.

2. Remove:
   - Front fork cap bolt "1" from the outer tube.

**TIP**
Hold the locknut "2" and remove the front fork cap bolt.

**REMOVING THE INNER TUBE**

1. Remove:
   - Dust seal "1"
   - Stopper ring "2"
   - Using slotted-head screwdriver.

**NOTE**
Take care not to scratch the inner tube.

2. Remove:
   - Inner tube "1"

**REMOVING THE DAMPER ROD**

1. Remove:
   - Base valve "1"
   - Damper rod "2"

**TIP**
Use a damper rod holder "3" to lock the damper rod.

**CHECKING THE DAMPER ROD**

1. Inspect:
   - Damper rod "1"
   - Bend/damage → Replace damper rod.

**NOTE**
The front fork with a built-in piston rod has a very sophisticated internal construction and is particularly sensitive to foreign material. Use enough care not to allow any foreign material to come in when the oil is replaced or when the front fork is disassembled and reassembled.

**CHECKING THE BASE VALVE**

1. Inspect:
   - Valve assembly "1"
   - Wear/damage → Replace.
   - O-ring "2"
   - Damage → Replace.

**CHECKING THE FORK SPRING**

1. Measure:
   - Fork spring free length "a"
   - Out of specification → Replace.

**Fork spring free length:**
- 460 mm (18.1 in)
- <Limit>: 455 mm (17.9 in)
CHECKING THE INNER TUBE
1. Inspect:
   • Inner tube surface "a"
     Score marks → Repair or replace. Use #1,000 grit wet sandpaper. Damaged oil lock piece → Replace.
   • Inner tube bends
     Out of specification → Replace. Use the dial gauge "1".

   Inner tube bending limit: 0.2 mm (0.008 in)

TIP
The bending value is shown by one half of the dial gauge reading.

WARNING
Do not attempt to straighten a bent inner tube as this may dangerously weaken the tube.

CHECKING THE OUTER TUBE
1. Inspect:
   • Outer tube "1"
     Score marks/wear/damage → Replace.

CHECKING THE FRONT FORK CAP BOLT
1. Inspect:
   • Front fork cap bolt "1"
   • O-ring "2"

     Wear/damage → Replace.

ASSEMBLING THE FRONT FORK
1. Wash the all parts in a clean solvent.
2. Install:
   • Damper rod "1" To inner tube "2".

   NOTICE
To install the damper rod into the inner tube, hold the inner tube aslant. If the inner tube is held vertically, the damper rod may fall into it, damaging the valve inside.

   3. Install:
      • Copper washer "1" New
      • O-ring "2"
      • Base valve "3" To inner tube "4".

   4. Tighten:
      • Base valve "1"

   Base valve:
   55 Nm (5.5 m•kg, 40 ft•lb)

   TIP
   • Use a damper rod holder "2" to lock the damper rod "3".
   • Apply the LOCTITE® on the base valve thread.

   Damper rod holder:
   YM-01494/90890-01494

5. Install:
   • Spring guide "1" New
   • Locknut "2" To damper rod "3".

   TIP
   • Install the spring guide with its smaller dia.end "a" facing downward.
   • With its thread "b" facing upward, fully finger tighten the locknut onto the damper rod.

6. Install:
   • Dust seal "1" New
   • Stopper ring "2" New
   • Oil seal "3" New
   • Oil seal washer "4" To inner tube "6".

   TIP
   • Apply the fork oil on the inner tube.
   • When installing the oil seal, use vinyl seat "a" with fork oil applied to protect the oil seal lip.
   • Install the oil seal with its manufacturer’s marks or number facing the axle holder side.
   • Install the oil seal washer with its projections "b" facing upward.
FRONT FORK

7. Install:
- Piston metal “1” New
  TIP
  Install the piston metal onto the slot on inner tube.

8. Install:
- Outer tube “1”
  To inner tube “2”.

9. Install:
- Slide metal “1”
- Oil seal washer “2”
  To outer tube slot.
  TIP
  Press the slide metal into the outer tube with fork seal driver “3”.

10. Install:
- Oil seal “1”
  TIP
  Press the oil seal into the outer tube with fork seal driver “2”.

  Tightness/binding/rough spots → Repeat the steps 2 to 12.

14. Compress the front fork fully.
15. Fill:
- Front fork oil
  Until outer tube top surface with recommended fork oil “1”.

Recommended oil:
Suspension oil “S1”

NOTICE
- Be sure to use recommended fork oil. If other oils are used, they may have an excessively adverse effect on the front fork performance.
- Never allow foreign materials to enter the front fork.

16. After filling, pump the damper rod “1” slowly up and down more than 10 times to distribute the fork oil.

17. Fill:
- Front fork oil
  Until outer tube top surface with recommended fork oil once more.
18. After filling, pump the outer tube "1" slowly up and down (about 200 mm (7.9 in) stroke) to distribute the fork oil once more.
  TIP
  Be careful not to excessive full stroke. A stroke of 200 mm (7.9 in) or more will cause air to enter. In this case, repeat the steps 15 to 18.
19. Wait ten minutes until the air bubbles have been removed from the front fork, and the oil has dispersed evenly in system before setting recommended oil level.

**TIP**
Fill with the fork oil up to the top end of the outer tube, or the fork oil will not spread over to every part of the front forks, thus making it impossible to obtain the correct level. Be sure to fill with the fork oil up to the top of the outer tube and bleed the front forks.

20. Measure:
- Oil level (left and right) "a"
  Out of specification → Adjust.

**Standard oil level:**
- 132 mm (5.20 in)
- Extent of adjustment: 95–150 mm (3.74–5.91 in)
- From top of outer tube with inner tube and damper rod "1" fully compressed without spring.

**TIP**
Be sure to install the spring guide "2" when checking the oil level.

**WARNING**
Never fail to make the oil level adjustment between the maximum and minimum level and always adjust each front fork to the same setting. Uneven adjustment can cause poor handling and loss of stability.

21. Measure:
- Distance "a"
  Out of specification → Turn into the locknut.

**Distance "a":**
- 18 mm (0.71 in) or more
- Between damper rod "1" top and locknut "2" top.

22. Loosen:
- Rebound damping adjuster "1"

**TIP**
- Loosen the rebound damping adjuster finger tight.
- Record the set position of the adjuster (the amount of turning out the fully turned in position).

23. Install:
- Push rod "1"
- Fork spring "2"

**TIP**
- Install the fork spring with the damper rod "3" pulled up.
- After installing the fork spring, hold the damper rod end so that it will not go down.

24. Install:
- Spring seat "1"
- Front fork cap bolt "2"

**TIP**
- Fully finger tighten the front fork cap bolt onto the damper rod.

25. Tighten:
- Front fork cap bolt (locknut) "1"

**Front fork cap bolt (locknut):**
- 29 Nm (2.9 m•kg, 21 ft•lb)

**TIP**
Hold the locknut "2" and tighten the front fork cap bolt with specified torque.

26. Install:
- Front fork cap bolt "1" To outer tube.

**TIP**
Temporarily tighten the cap bolt.

27. Install:
- Protector guide "1"

**TIP**
Install the protector guide with its wider side "a" facing downward.

   **Pinch bolt (lower bracket):**
   21 Nm (2.1 m•kg, 15 ft•lb)

   **WARNING**
   Tighten the lower bracket to specified torque. If torqued too much, it may cause the front fork to malfunction.

5. Install:
   • Speed sensor lead "1"
   • Plate 1 "2"
   • Bolt (plate 1) "3"

   **Bolt (plate 1):**
   4 Nm (0.4 m•kg, 2.9 ft•lb)

HANDLING NOTE

**WARNING**

- Support the machine securely so there is no danger of it falling over.
- This rear shock absorber is provided with a separate type tank filled with high-pressure nitrogen gas. To prevent the danger of explosion, read and understand the following information before handling the shock absorber. The manufacturer cannot be held responsible for property damage or personal injury that may result from improper handling.
- Never tamper or attempt to disassemble the cylinder or the tank.
- Never throw the rear shock absorber into an open flame or other high heat. The rear shock absorber may explode as a result of nitrogen gas expansion and/or damage to the hose.
- Be careful not to damage any part of the gas tank. A damaged gas tank will impair the damping performance or cause a malfunction.
- Take care not to scratch the contact surface of the piston rod with the cylinder; or oil could leak out.
- Never attempt to remove the plug at the bottom of the nitrogen gas tank. It is very dangerous to remove the plug.
- When scrapping the rear shock absorber, follow the instructions on disposal.

**NOTES ON DISPOSAL (YAMAHA DEALERS ONLY)**

Before disposing the rear shock absorber, be sure to extract the nitrogen gas from valve “1”. Wear eye protection to prevent eye damage from escaping gas and/or metal chips.

**WARNING**

To dispose of a damaged or worn-out rear shock absorber, take the unit to your Yamaha dealer for this disposal procedure.

CHECKING THE REAR SHOCK ABSORBER

ELECTRIC STARTING SYSTEM

STARTING CIRCUIT CUT-OFF SYSTEM OPERATION

If the main switch is set to "ON", the starter motor can only operate if at least one of the following conditions is met:
• The transmission is in neutral (the neutral switch is closed).
• The clutch lever is pulled to the handlebar (the clutch switch is closed).

The starting circuit cut-off relay prevents the starter motor from operating when neither of these conditions has been met. In this instance, the starting circuit cut-off relay is open so current cannot reach the starter motor. When at least one of the above conditions has been met the starting circuit cut-off relay is closed and the engine can be started by pressing the start switch.

**TIP**

- Remove the following parts before inspection.
  1. Seat
  2. Fuel tank
  3. Left side cover
- Use the following special tools in this inspection.

Pocket tester: YU-3112-C/90890-03112
CHECKING THE TAILLIGHT (LEDs)
1. Disconnect the taillight coupler.
2. Connect two jumper leads “1” from the battery terminals to the respective coupler terminal as shown.

<table>
<thead>
<tr>
<th>Battery (+) terminal</th>
<th>Blue lead “2”</th>
</tr>

<tbody>
<tr>
<td>Battery (-) terminal</td>
<td>Black lead “3”</td>

3. Check:
   • LED (for proper operation)
     Does not light → Replace the tailight assembly.

WARNING
   • A wire that is used as a jumper lead must have at least the same capacity of the battery lead, otherwise the jumper lead may burn.
   • This check is likely to produce sparks, therefore, make sure no flammable gas or fluid is in the vicinity.

CHECKING THE AC MAGNETO
1. Inspect:
   • Lighting coil resistance
     Out of specification → Replace.

</tbody>
</table>

CHECKING THE RECTIFIER/REGULATOR
1. Connect the battery leads.
2. Start the engine.
3. Turn on the headlight and taillight by turning on the light switch.
4. Inspect:
   • Out-put voltage
     Out of specification → Replace rectifier/regulator.

**TIP**

- Remove the following parts before inspection.
  1. Headlight
- Use the following special tools in this inspection.

Pocket tester:

YU-3112-C/90890-03112
CHECKING THE COUPLERS AND LEADS CONNECTION
1. Check:
   • Couplers and leads connection
     - Rust/dust/looseness/short-circuit
     → Repair or replace.

CHECKING THE MULTI-FUNCTION DISPLAY INPUT VOLTAGE
1. Disconnect the multi-function display coupler.
2. Set the main switch to "ON".
3. Measure:
   • Multi-function display input voltage
     - Out of specification → Replace wire harness.

CHECKING THE MULTI-FUNCTION DISPLAY OUTPUT VOLTAGE
1. Disconnect the multi-function display coupler.
2. Set the main switch to "ON".
3. Measure:
   • Multi-function display output voltage
     - Out of specification → Replace multi-function display.

CHECKING THE SPEED SENSOR OUTPUT VOLTAGE
1. Insert the thin electric conductors “1” (lead) into the speed sensor coupler “2”, as shown, and connect the tester to them.
2. Set the main switch to "ON".
3. Measure:
   • Speed sensor output voltage
     - Output voltage not correct → Replace the speed sensor.

NOTICE
Make sure that a short-circuit does not develop between the terminals because it may cause damage to electrical components.

NOTICE
Make sure that a short-circuit does not develop between the terminals because it may cause damage to electrical components.

Measurement steps:

a. Elevate the front wheel and slowly rotate it.
   b. Measure the voltage (DCV) of the leads. With each full rotation of the front wheel, the voltage reading should cycle from 0.6 V to 4.8 V to 0.6 V to 4.8 V.
